Preface

About this Product

The genuReSI (Remote Secure Integration) Windows application offers a clear, easy-to-use interface for the configuration, administration and supervision of maintenance associations used within the Rendezvous maintenance concept.

Formatted Text

- **Text**: Console input or output, commands, filenames and path
- “Text”: Text to be entered into GUI fields; names of icons, links, and external applications
- **Key**: Key on the keyboard or button in the GUI
- **Menu** → **Submenu**: Menu path in the GUI

Warnings

Note: Notes provide additional information suitable for simplifying certain workflows or highlighting feature limitations.

Attention! The level Attention warns about minor security risks, minor or short-term disruption in operation.

Warning! The level Warning warns about major security risks, major or long-term disruptions of operation.

Danger! The level Danger warns about severe security risks, complete or permanent disruption in operation or permanent loss of data, if not observed.

Changes to the Manual

The manual is updated for every new release to reflect the changes to the software. It describes the respective current state of the genuReSI software.

Customer Portal of genua

Our customer portal can be reached under <https://kunde.genua.de/en.html/>. After you have logged in with your credentials, select **Products** → **genubox** → **Maintenance App (genuReSI)** in the main navigation to enter the customer support area of genubox and genuReSI.

Here you can access the Knowledge Base, Best Practices, Known Issues, Release Notes and Software Patches.

Feedback on the Manual

Your opinion is important to us. Please contact us if you require further information. Just send us an e-mail to: support@genua.de

Chapter 1

Maintenance with the Rendezvous Concept

1.1	The genua rendezvous concept	2
1.2	Using the genuReSI Maintenance Application	3

1.1 The genua rendezvous concept

Figure 1.1: rendezvous concept

At the heart of the rendezvous concept is the rendezvous server (typically a genubox). This server can be located in the DMZ of the equipment manufacturer or service provider. A genubox operates as a firewall and VPN solution upstream of the equipment being maintained, isolating the equipment from the rest of the IT network.

The maintenance time frame is usually precisely defined. The **remote service provider** first establishes a VPN connection to the Rendezvous Box and must authenticate there. However, he cannot establish any direct connections to the customer network. The **operator** (an administrator from the customer network) must establish the connection between the rendezvous server and the service box. The connection between the maintainer and the object being maintained is then established via these two VPN tunnels. The maintainer can launch his software, authenticate with the machine being maintained, and start working.

The connection from the maintainer to the rendezvous server is established via SSH VPN.

After the maintenance work is finished, both the maintainer and the operator terminate the established connections.

Neither the maintainer nor the operator require deep knowledge of the system, since the entire rendezvous solution is configured centrally via the rendezvous server and a management system (genucenter).

1.2 Using the genuReSI Maintenance Application

Using the genuReSI (genua Remote Secure Integration) Windows application, the maintainer can establish the maintenance connection with a mouse click. This permits easy configuration and administration of the maintenance association via the easy-to-use GUI.

All sessions are logged. Depending on the configuration, they can also be recorded. This can be used for training purposes, for example.

The operator can also use genuReSI to enable the maintenance connection if he prefers a Windows application over the web-based GUI.

Chapter 2

Launching the genuReSI Windows Application

2.1	Installation Requirements	6
2.2	Installation and Configuration	7

2.1 Installation Requirements

- Configuration file `<config name>.resi` and the password that can be assigned to protect the configuration file. This is generated and made available on the genucenter by the equipment manufacturer or maintenance operator.
- Executable file `ReSI.exe` (the most recent version is available for download in the genua customer portal at <https://support.genua.de/genubox/resi/ReSI.exe>). Execute the file as a normal user to start genuReSI App. The app does not require installation or administrator privileges.

Note: genuReSI App is digitally signed by a genua certificate. The signature is automatically verified by Windows. Alternatively, you can verify the signature manually as follows:

1. Right click on the genuReSI app icon and navigate to [Properties](#) → [Digital Signatures](#).
2. Select the certificate **genua GmbH** and click on [Details](#). In the **General** tab, information regarding the validity of the certificate is displayed.

- PC with a Windows OS that supports Microsoft .Net Framework version 4.8 and higher
- Microsoft .NET Framework version 4.8 and higher

Note: This version of the Microsoft .NET Framework is automatically installed with Windows 7 SP2 or higher. For older versions, the Client Profile may be downloaded in the Microsoft customer portal. Alternatively, you can use the external download link in the genua customer portal. Visit <https://kunde.genua.de/en>, log in and click on [Downloads](#) → [Releases](#) → [Maintenance App 1.21 Release](#). The download link is in the **genubox** section.

2.2 Installation and Configuration

2.2.1 Installation genuReSI

Move the [ReSI.exe](#) file to the desired directory, for example:

C:\Users\<<Username>\Desktop

on the genuReSI icon to launch the application.

Before starting, enter a configuration password to prevent unauthorized access. The password can also be saved by selecting “Save Password”.

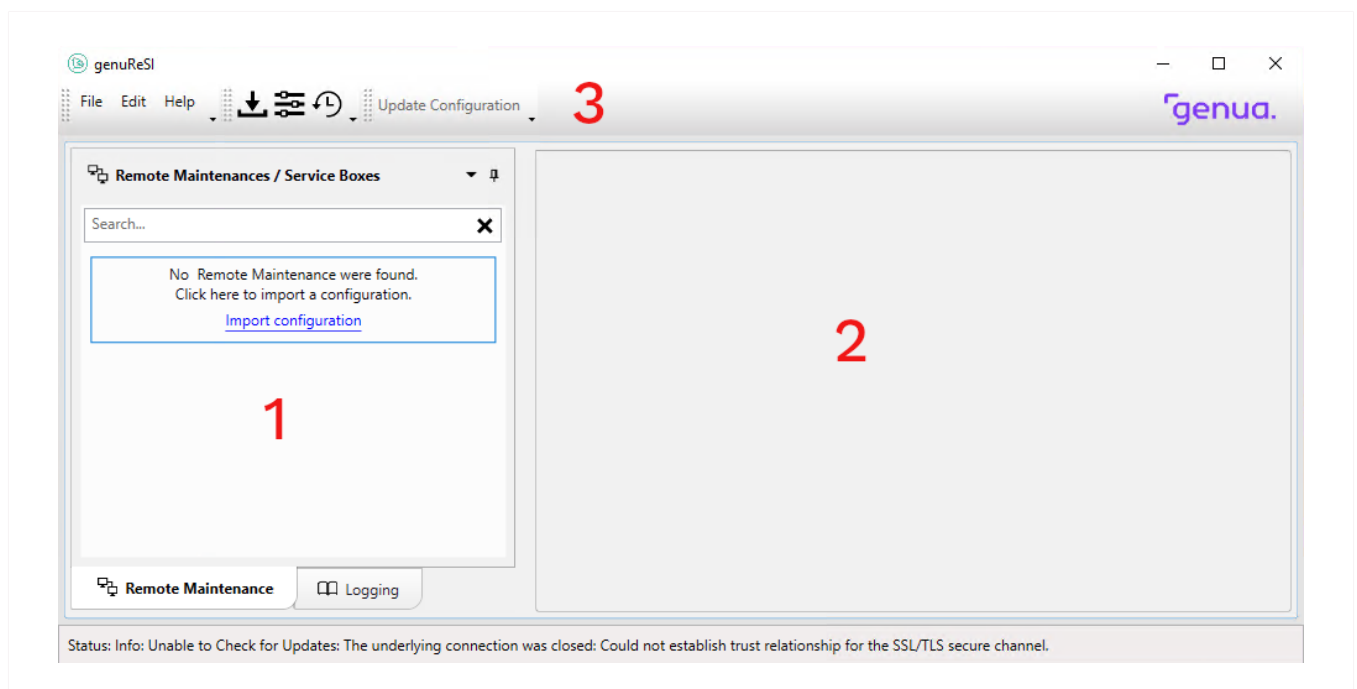

Figure 2.1: genuReSI Start Screen

1. Rendezvous connection/logging selection window
2. Main window
3. Toolbar

Meaning of the icons from left to right:

- Import configuration
- Settings
- History

2.2.2 Importing the Configuration

The corresponding dialog will be opened by any of the following: Via the **File** → **Import configuration** menu, the link in the left window, the import button in the toolbar (second icon from the left), or the key combination **Ctrl+I**. Only applicable configuration files (*.resi) are shown here. Select the applicable configuration file and click on **Open**.

If the configuration file is password protected, the password must be entered and confirmed with **OK**. If the configuration already exists, a message is displayed and the configuration can be renamed or canceled.

The imported configuration appears in the left window under **Maintenances / Service Boxes**. If multiple configurations are available, you have to import the other configuration files accordingly. The applicable configuration can be selected later in the left window.

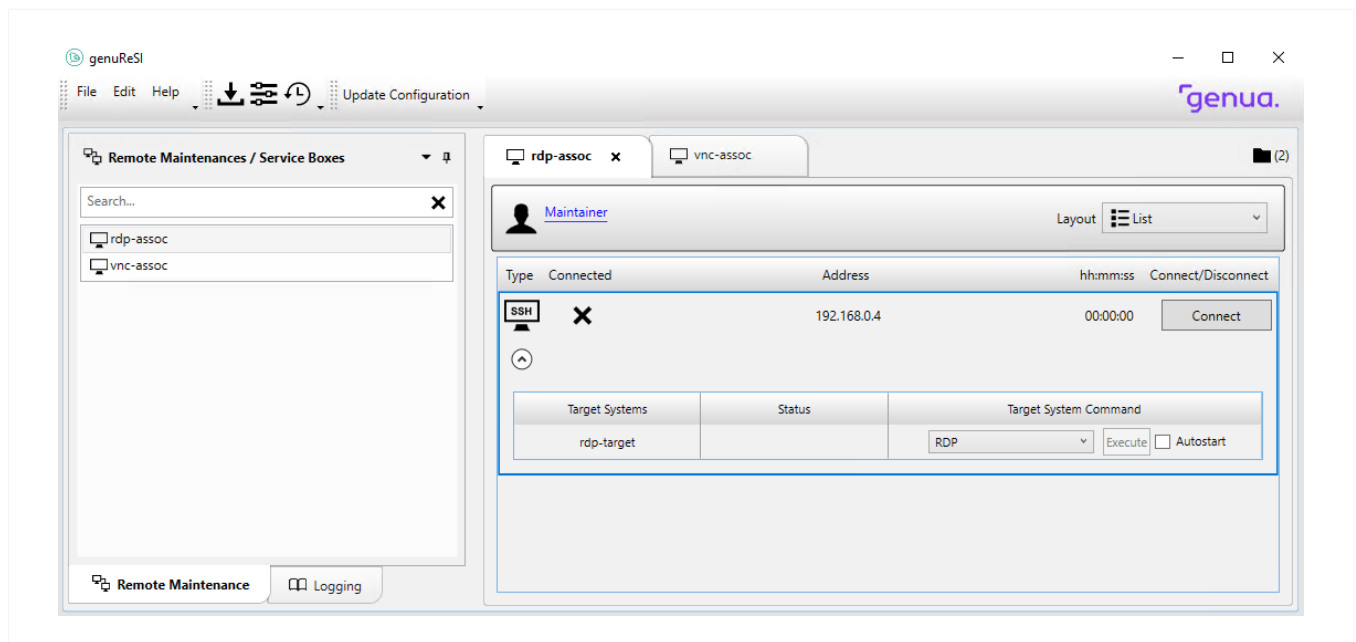

Figure 2.2: Maintenances / Service Boxes

Chapter 3

genuReSI for Maintainers

3.1	Duties of the Maintainer	10
3.2	Establishing/Terminating the Maintenance Connection	10
3.3	Recording the Connection using RDP	13
3.4	Data Exchange between Maintainer and Target System	13
3.5	Configuration Updates	14
3.6	Logging/History	15
3.7	Local Settings	17
3.8	Commands	19
3.9	Plugins	20
3.10	genuReSI Update	21
3.11	genuReSI USB/Portable Mode	21

3.1 Duties of the Maintainer

As the **maintainer**, you are responsible for establishing and terminating connections to the rendezvous server. The operator establishes the connection from the service box to the rendezvous server. **Both connections** must be established before the target system being maintained can be accessed. The configuration data is imported via the configuration file. It cannot be modified locally.

3.2 Establishing/Terminating the Maintenance Connection

The imported rendezvous connections are listed on the left side of the screen. Details about each connection are displayed on the right. After selecting the connection, click on [Connect](#) to connect to the Rendezvous Box.

If the **Activate History** menu item is enabled in the **Settings**, you may then enter a description for the connection (for logging).

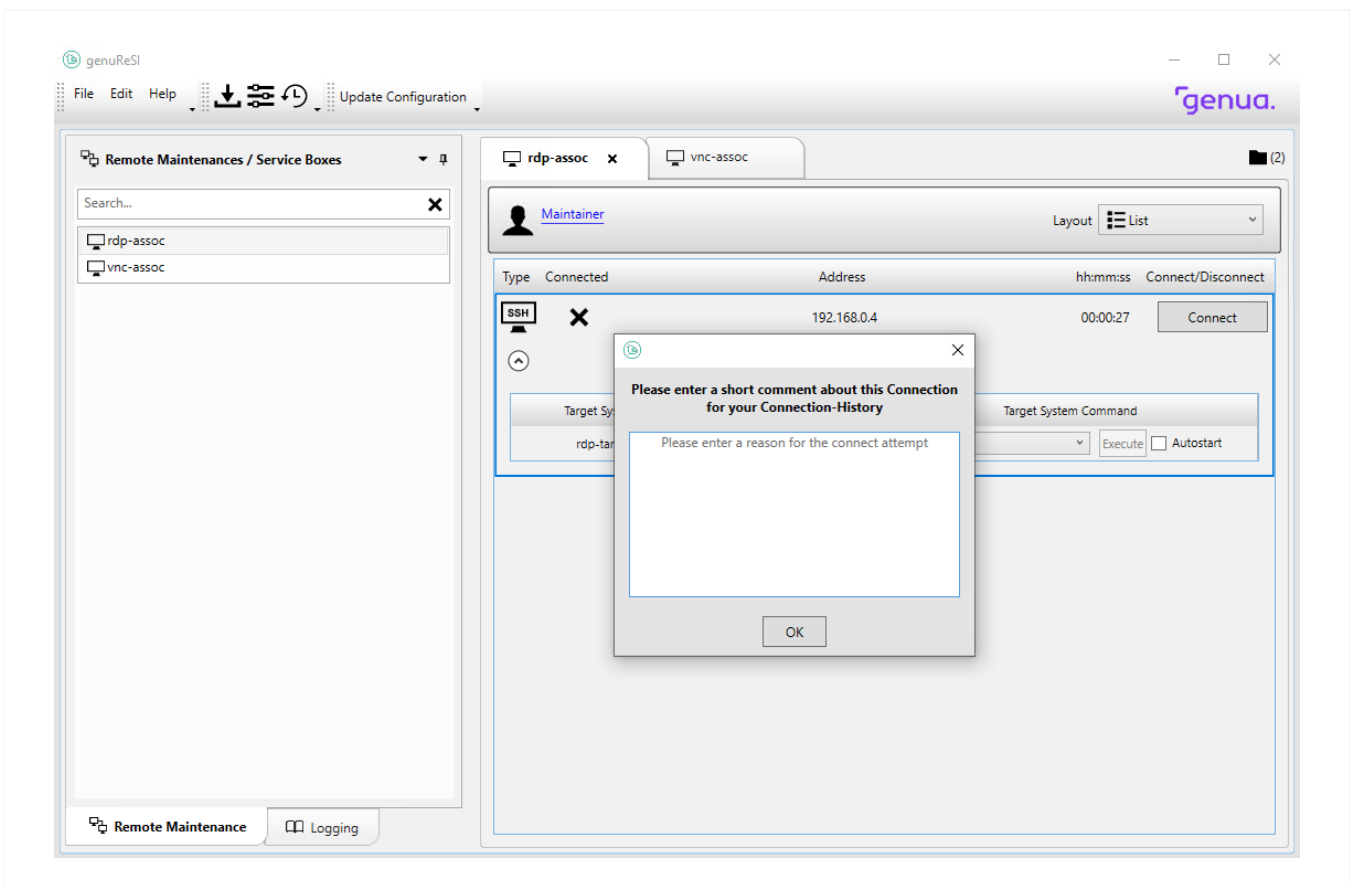

Figure 3.1: Establishing the connection – Maintainer

Note: If an authorization via LDAP/Active Directory is configured for the connection, you may have to use a custom LDAP login name to access the Rendezvous Box. In this case, enter the LDAP login name at [Settings](#) → [SSH](#) in the **LDAP Loginname** field.

Note: If the administrator configured the connection as a high availability setup with multiple Rendezvous Boxes, the additional drop-down menu **Automatic** is displayed under **Address**. If required, this menu allows the manual selection of a single Rendezvous Box from the setup to connect to the target system. Per default, a random Rendezvous Box is chosen.

If the connection has been established, this will be indicated with a check mark in the upper section (1) under “Connected”. The “Disconnect” button can be used to terminate the connection to the rendezvous server.

In the lower section (2), the information displayed under Status indicates whether the operator has successfully established the connection from the rendezvous server to the genubox upstream of the machine being maintained. The name shown here is the name specified in the genucenter GUI for “Name for Maintainer”. If nothing was entered in “Name for Maintainer”, genuReSI displays the name of the connection. Press **Ctrl** + **D** to view additional technical details (port, local and remote IP) for the connection.

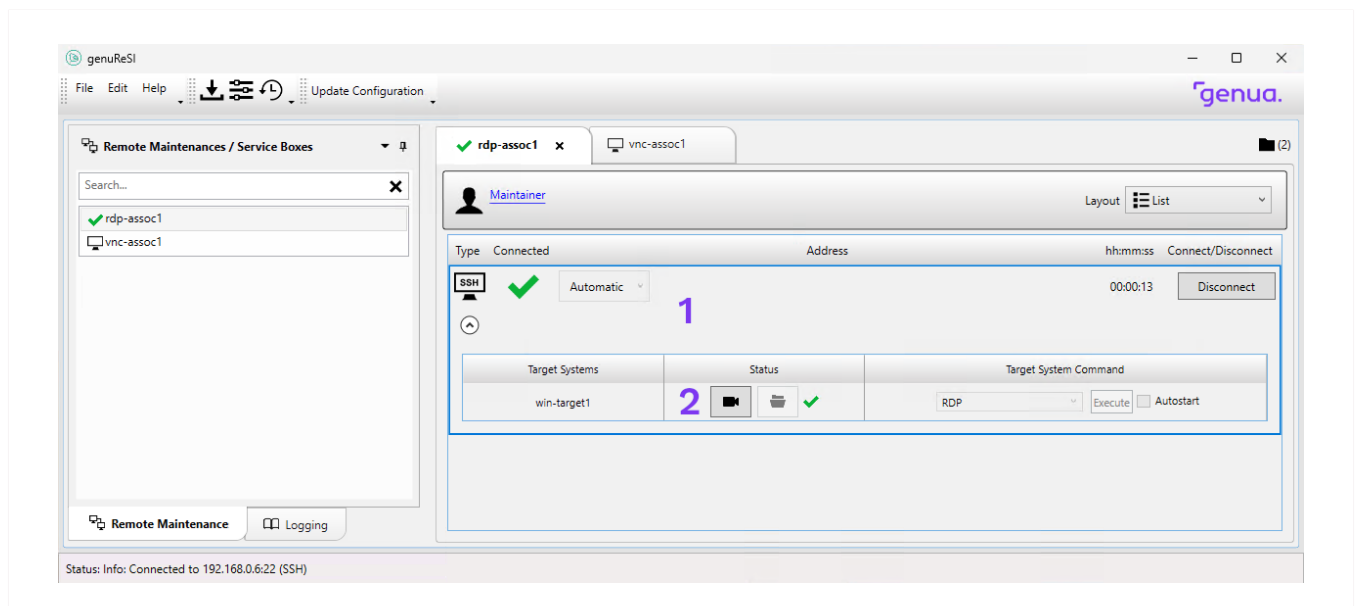

Figure 3.2: Window Layout

3.2.1 Optional Setting: Email Messaging

If the administrator configured the Rendezvous Box for the optional email delivery, an additional button is displayed in the connection details. This button is either named **Request Access** or **Waiting for access...** This button is grayed out until you connect to the Rendezvous Box.

- If the button **Request Access** is available after connecting to Rendezvous Box, the Operator has not yet initialized the connection to the target system. However, you can request access via email. Clicking the button causes the Rendezvous Box to send an automated email request to the operator. The button name changes to **Waiting for access...** and the button is grayed out. You can start the maintenance session as soon as the operator initializes the connection.
- If the button **Request Access** is still grayed out after connecting to the Rendezvous Box, there are two possibilities:
 - The Operator has not yet initialized the connection to the target system. Also, he cannot be contacted via automated email. Contact the Operator via other means (e.g. phone) and wait until the connection is initialized.
 - The connection is already initialized. Connect to the target system to start the maintenance.

Note: Initialized connections are identified by the  icon that is displayed in the **Tunnel Status** column at the expanded connection details. Depending on the configuration, the Rendezvous Box also informs you via email when the connection is initialized.

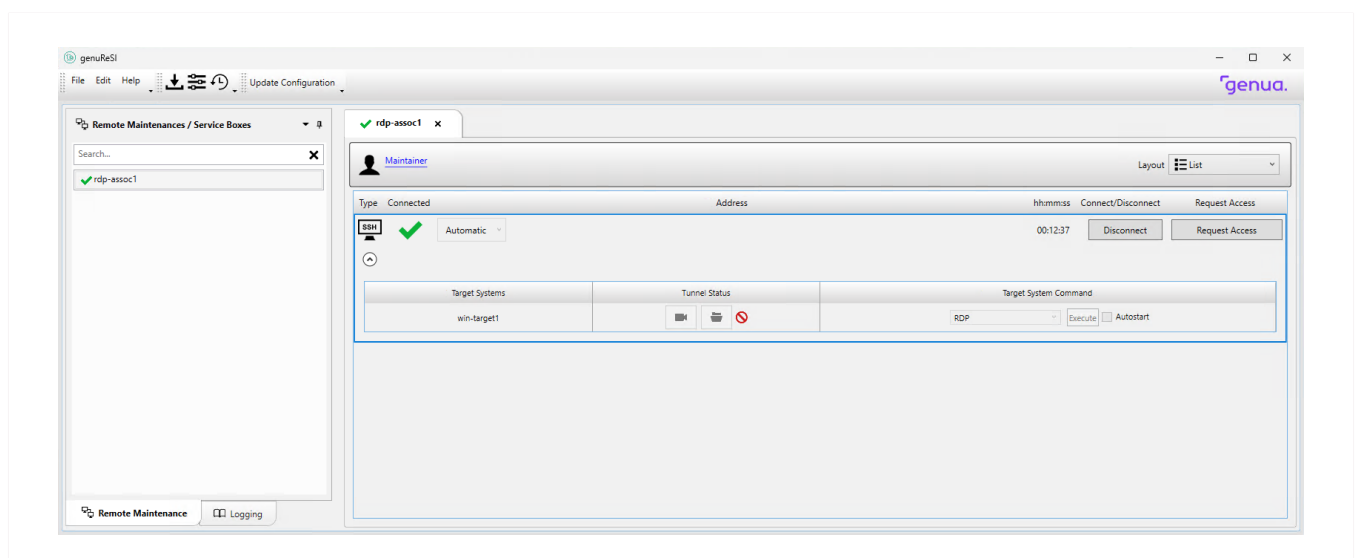

Figure 3.3: Detailed view with optional email delivery

3.3 Recording the Connection using RDP

It is possible to record RDP, SSH, and VNC sessions, and to monitor active sessions (recording function). This must be started by the **operator**. The maintainer cannot control this. The camera icon for the connection indicates whether recording is configured.

In some cases, personal data of the maintainer may be affected by a recording. If this is the case, a privacy disclaimer informs you about how this personal data is acquired and processed. The maintenance connection will be canceled if you do not agree to the disclaimer.

Figure 3.4: Recording Connections

The status information for an established connection shows whether this session is being recorded or monitored. In our example, the session is being recorded and actively monitored, and the maintainer has access to the target system.

Figure 3.5: Session Recording Indicator

3.4 Data Exchange between Maintainer and Target System

The maintainer can upload data to the target system, or download data from the target system (also called the “Share Option”). This function must be started by the **operator**. The maintainer cannot control this. The exchange icon for the connection under Status indicates whether data exchange is configured (see figure 3.4).

Clicking on the icon opens the File Exchange Explorer. The data exchange is implemented using an RDP drive. The data is thus retained after terminating the session. File transfers are logged and the operator can also track them afterwards. If a virus scanner connected via ICAP has been configured for the Rendezvous Box, transferred files will be checked for malware automatically. The files will only be available after the virus scanner has approved them. The file transfer status displays more information about this process when necessary.

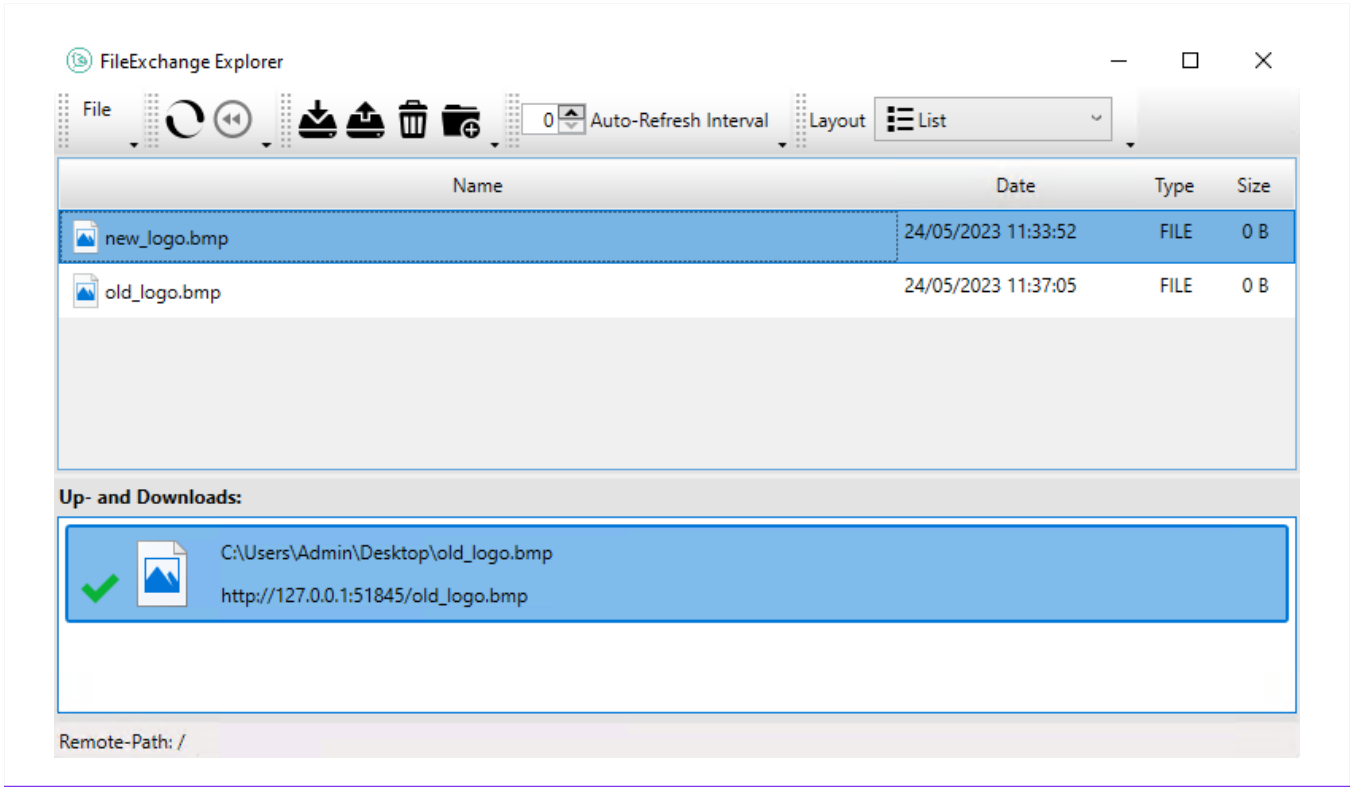

Figure 3.6: File Exchange Explorer

The upper window of the explorer displays all available objects. The lower window displays the current transfers. The menu provides icons for uploading and downloading, creating a new folder, and deleting objects. The displayed information does not update automatically by default, but it can be configured to do so. In addition, objects can be viewed as icons or in list format.

3.5 Configuration Updates

The maintainer needs a valid configuration file for the initial connection between genuReSI App and Rendezvous Box. Usually, this file is created by the administrator in the Central Management Station genucenter.

Once an active SSH connection to the Rendezvous Box is established, configuration changes are automatically transmitted and displayed with every genuReSI status check. Such changes can, e.g., add new connections. Therefore, there is no need to manually update configuration files, as long as the maintainer is able to connect to the Rendezvous Box with the latest configuration.

Alternatively, click [Update Configuration](#) in the title bar. genuReSI App checks for updates on every Rendezvous Box configured for SSH and updates the local configuration as required.

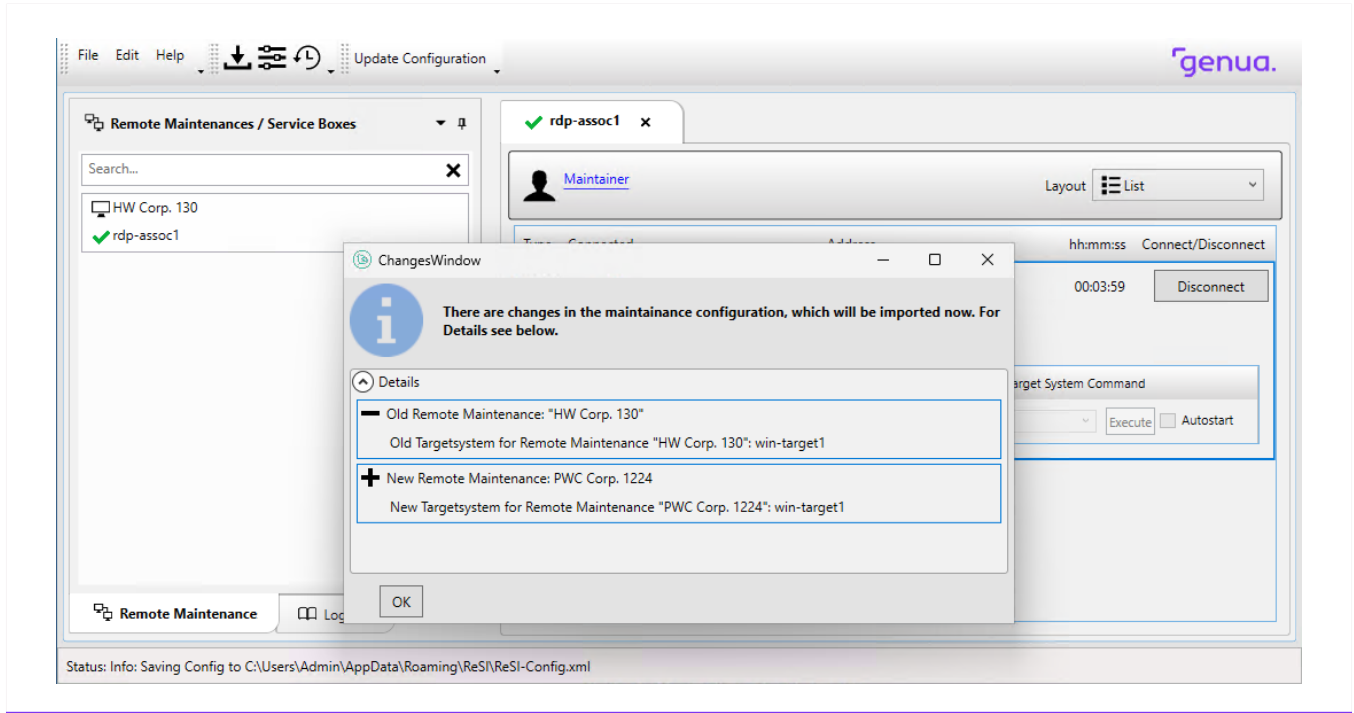

Figure 3.7: Updated Configuration (Extended View)

3.6 Logging/History

Clicking on the **Logging** tab in the main window displays the genuReSI log data and the connections. The logging levels **Info**, **Debug**, and **Error** are available. The default logging level is **Info**.

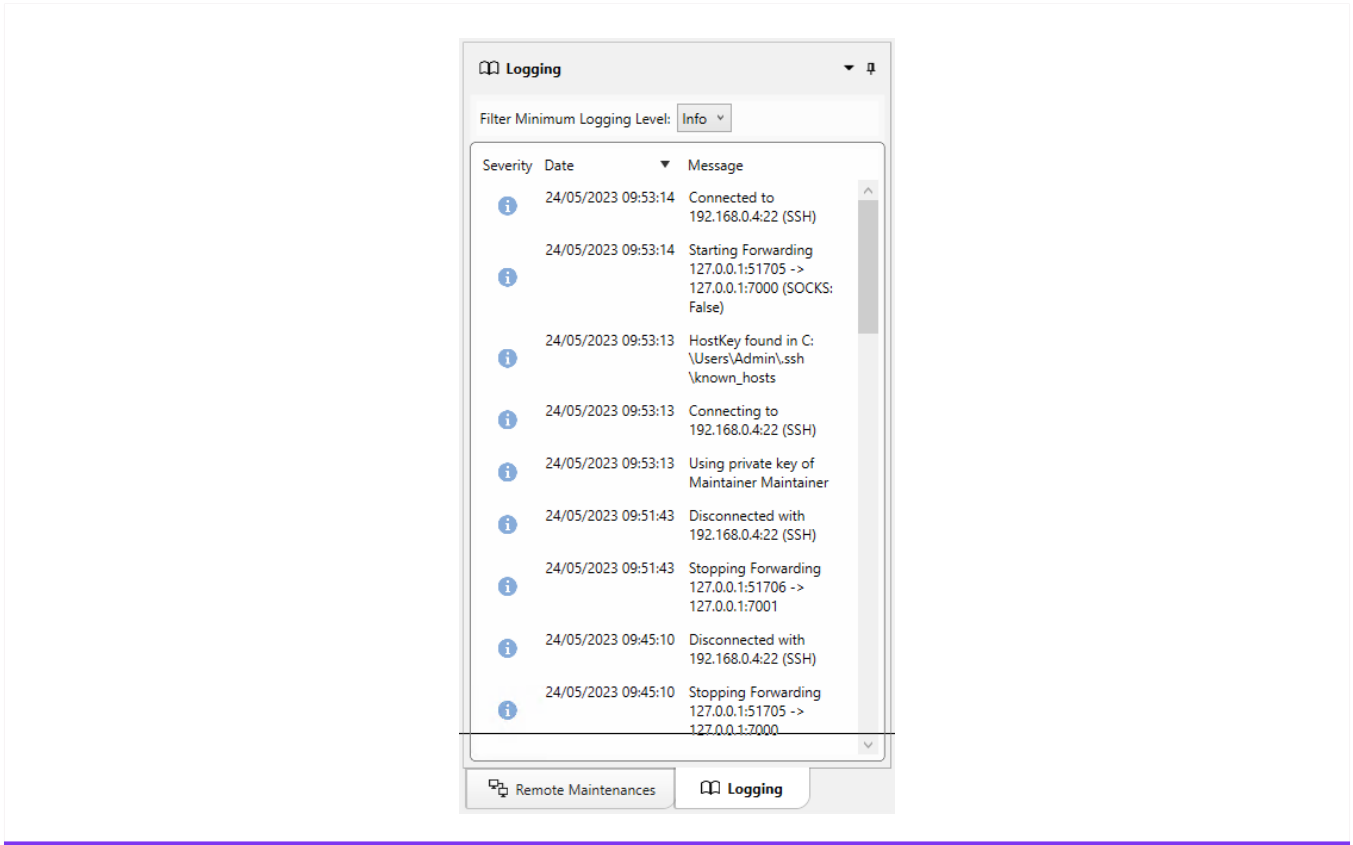

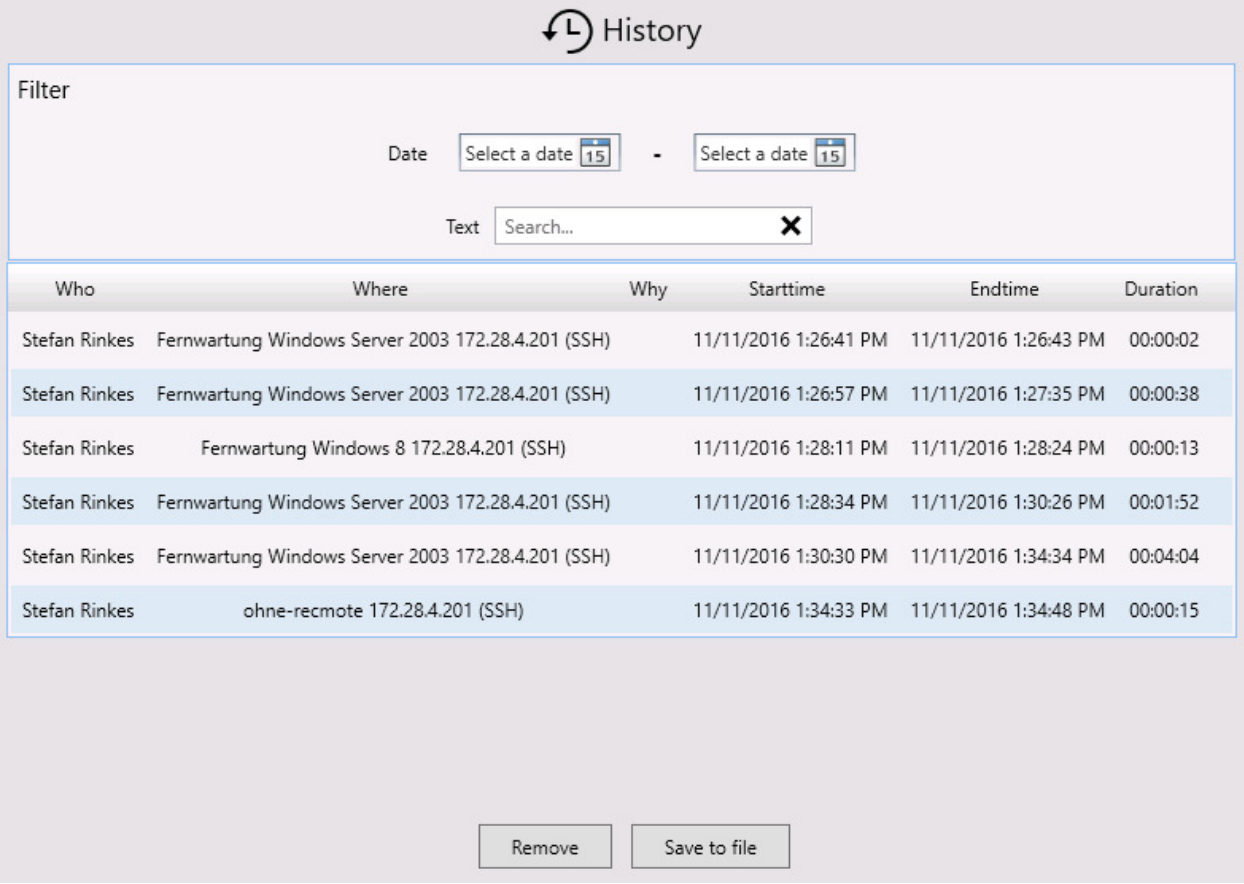

Figure 3.8: Logging

To show the connection data for the recent connections (History), select the last icon in the toolbar: **History**. In the history window, the time frame for the connections can be defined and search text can be entered. The data can be saved to a local file so it can be included with a support request, for example, to assist with troubleshooting.

Who	Where	Why	Starttime	Endtime	Duration
Stefan Rinkes	Fernwartung Windows Server 2003 172.28.4.201 (SSH)		11/11/2016 1:26:41 PM	11/11/2016 1:26:43 PM	00:00:02
Stefan Rinkes	Fernwartung Windows Server 2003 172.28.4.201 (SSH)		11/11/2016 1:26:57 PM	11/11/2016 1:27:35 PM	00:00:38

Figure 3.9: Maintenance Connection History

3.7 Local Settings

A number of settings can be configured using the **Settings** icon in the toolbar:

- **Application Settings:**
General settings can be configured here, such as theme, activation of history and logging level.
- **SSH:**
SSH settings can be configured here, such as SSH forwarding and LDAP username, but also the network adapter for mapping addresses. Additionally, you can allow or deny other system users to access your port forwardings.

Note: The administrator can permanently enable or disable this access to your port forwardings. See section 5.6 for more information.

- **Plugins:**
Installing/uninstalling plugins, see chapter 3.9.

- **Smartcard:**
File path to the smart card middleware.
- **Commands:**
Definition of commands, see chapter 3.8.
- **Roles:**
Overview of available roles and settings.

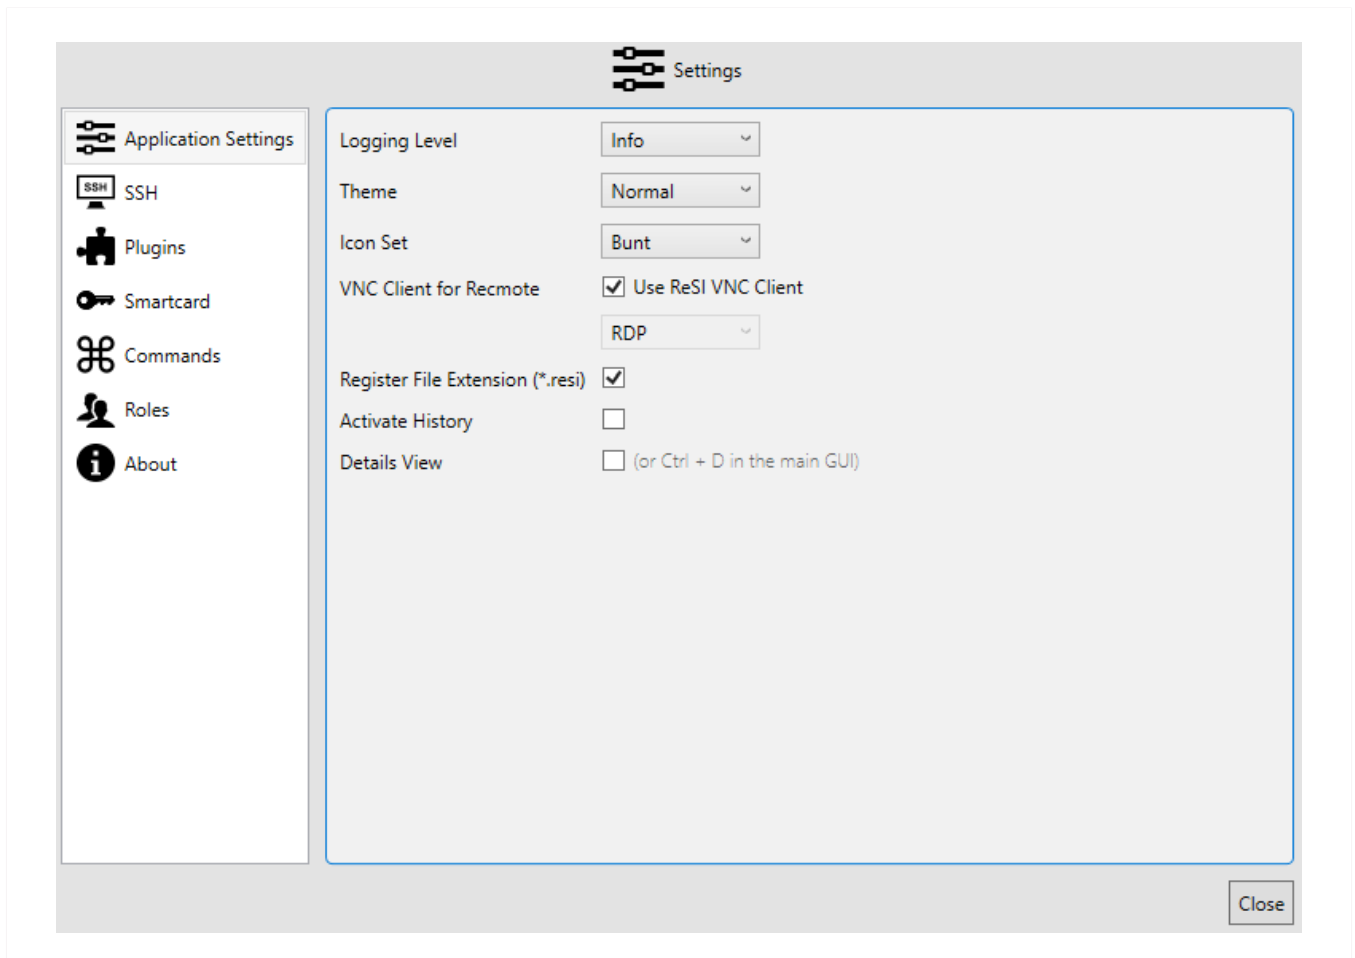

Figure 3.10: Remote Maintainer Settings

3.8 Commands

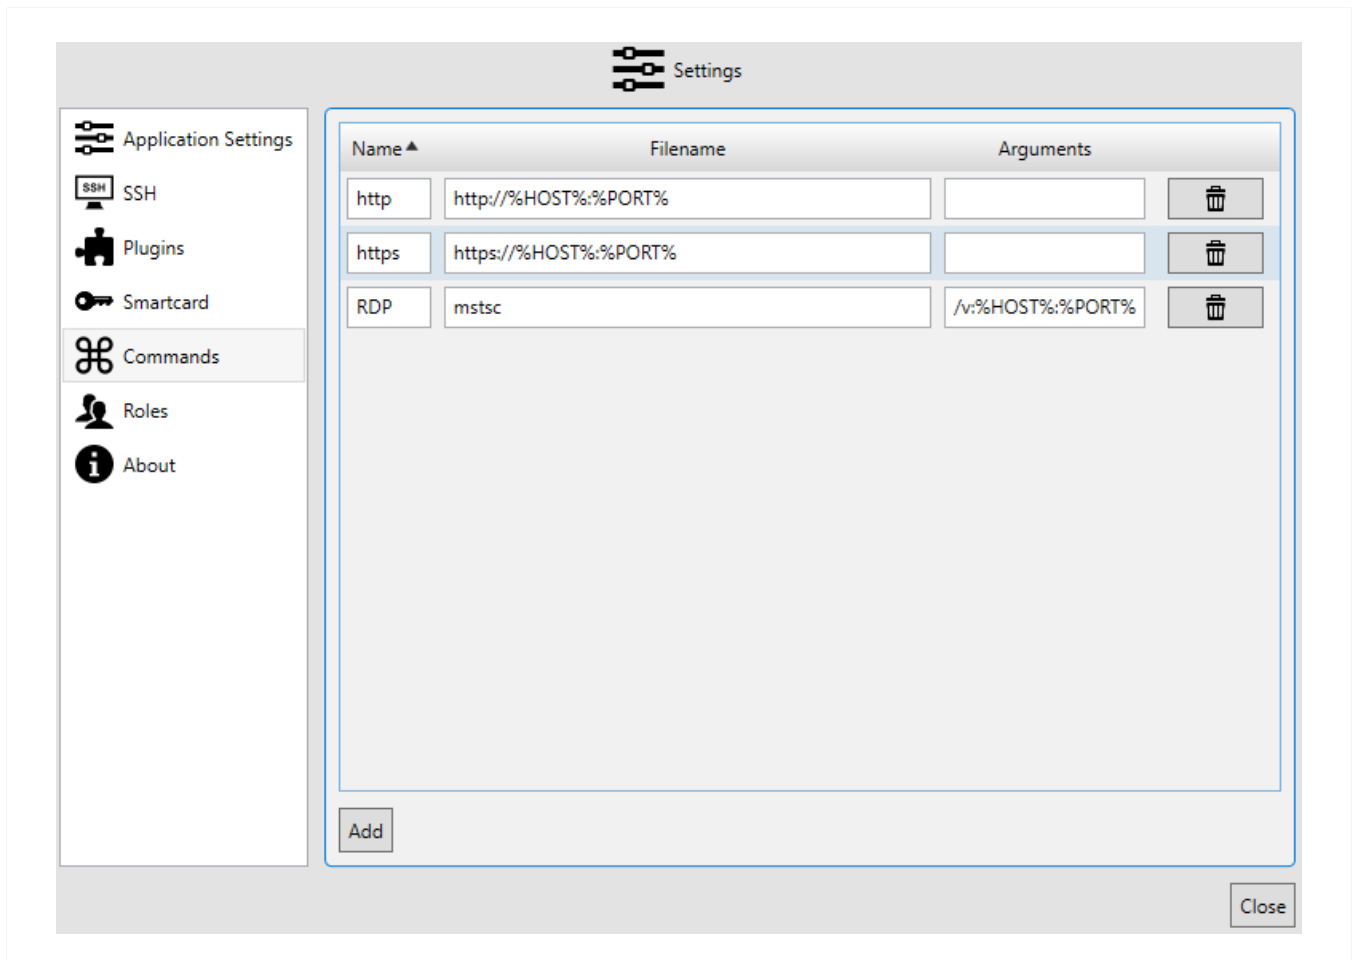

Figure 3.11: Commands Settings

Various protocols can be used to access the maintained machine, such as RDP (Remote Desktop Protocol) from Microsoft or SSH (Secure Shell). Define the commands required for this from the **Commands** menu in the toolbar. RDP is always predefined. In our example, access via SSH using PuTTY was added. The commands defined here are available in the main window for an existing connection. They can be selected and started there. If **Autostart** is selected, these commands are automatically started with the rendezvous connection.

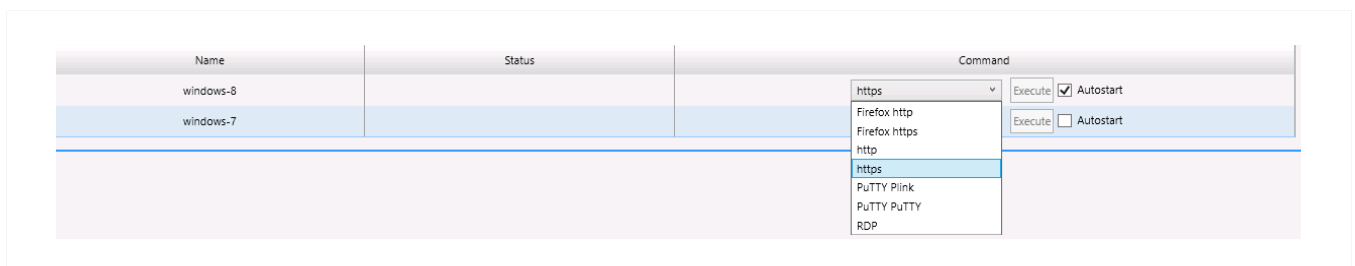

Figure 3.12: Autostart Function

3.9 Plugins

Plugins make it easy for users to add features to their genuReSI setup. There are currently two types of plugins available: command and theme plugins.

Plugins are ZIP files containing a plugin info file and the files that the plugin requires. The current plugins, for example, are Firefox, OpenSSH, PuTTY, and UltraVNC. Always use the latest plugin version available. Please check that plugin and system architecture are identical (32 or 64 bit).

Plugins are installed/uninstalled via the [Settings](#) → [Plugins](#) menu.

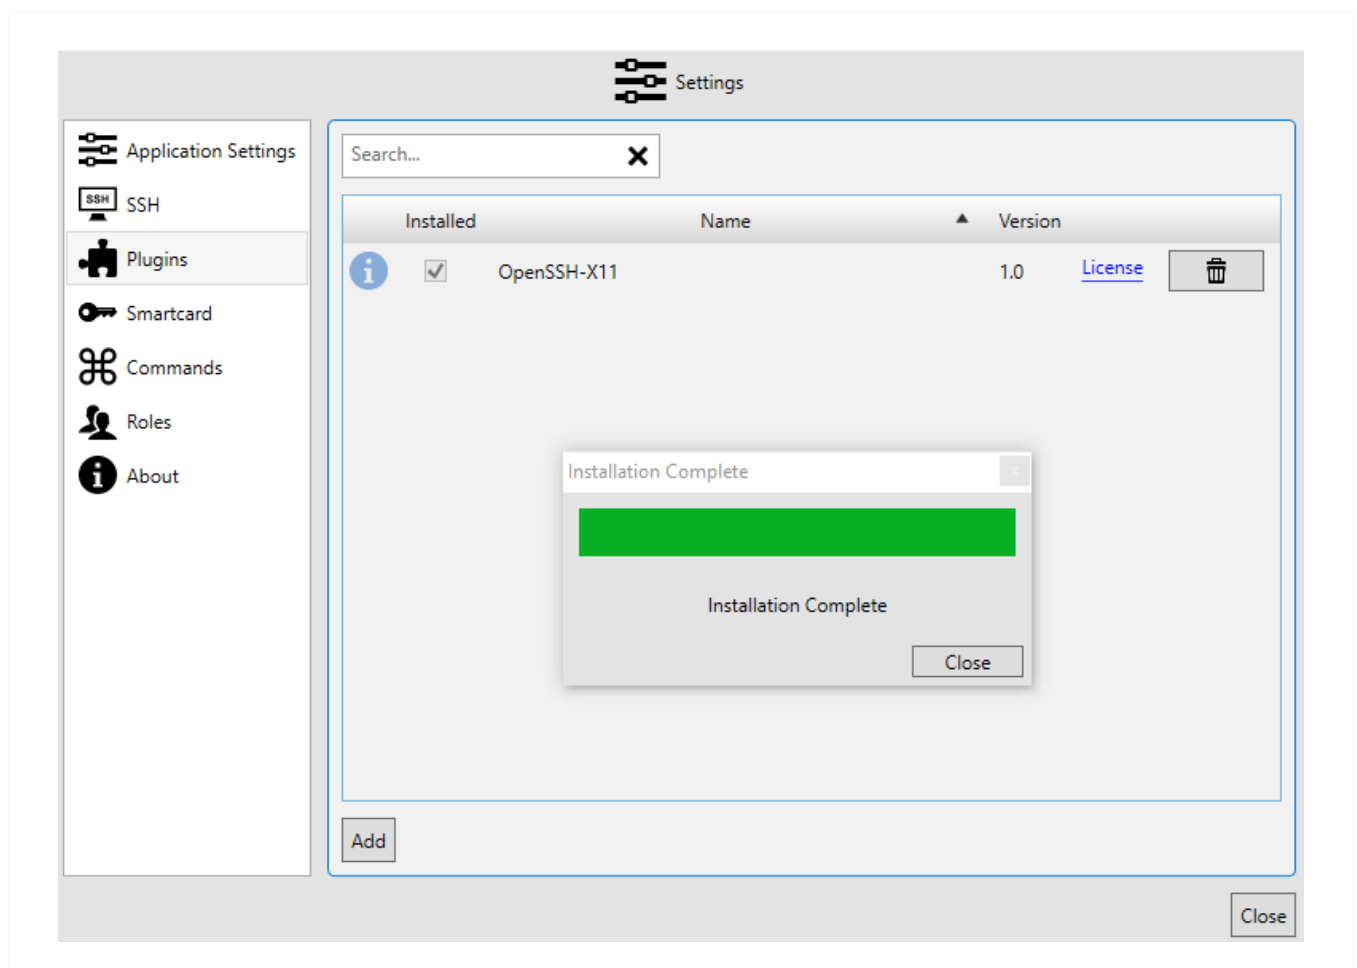

Figure 3.13: Plugins

Note: Follow these steps to use a VNC client made available as plugin.

1. Change to
[Edit](#) → [Settings](#) → [Application Settings](#)
2. Deactivate the checkbox **Use genuReSI VNC Client**
3. Choose your client in the selection menu below.

Note: VNC connections are supported according to the Remote Framebuffer Protocol (RFC 6143).

3.10 genuReSI Update

genuReSI has an autoupdate feature: When the app is started, it automatically checks for updates of the [ReSI.exe](#) file. If a new version is available, the dialog box **Update Available** is displayed. Click [Yes](#) to install the update. After that, restart the genuReSI application.

The update installs the latest version of the [ReSI.exe](#) file. The previous version is stored as [ReSI_old.exe](#).

The autoupdate feature is enabled by default. To disable the feature, navigate to [Settings](#) → [Application Settings](#) and deactivate the checkbox **Check for Updates on Start**. All updates have to be triggered manually now.

Note: Do not forget to update plugins in use.

3.11 genuReSI USB/Portable Mode

To make the genuReSI application available on any computer, it can be installed on a USB stick and opened from there. USB mode can also be launched in read-only mode. In this case, all write operations are disabled. This means the configuration cannot be saved. Thus, you can first launch genuReSI and then immediately remove the USB stick.

Chapter 4

genuReSI for Operators

4.1	Duties of the Operator	24
4.2	Establishing/Terminating the Maintenance Connection	24
4.3	Access Control at Runtime	26
4.4	Recording the Connection with RDP and SSH	27
4.5	Share Option	28
4.6	Configuration Updates	29
4.7	Logging/History	30
4.8	Local Settings	32
4.9	genuReSI Update	33

4.1 Duties of the Operator

As an **operator**, you are responsible for establishing and terminating the connection from the rendezvous server to the genubox upstream of the maintained target system. Without this connection, the maintainer **cannot** establish the maintenance connection.

Note: If the administrator configured the optional email delivery, the Rendezvous Box will automatically create an email with the relevant information and send it to your email account upon receiving a connection request. Depending on the configuration, the Rendezvous Box also informs the maintainer via email when the connection is initialized.

The operator also determines whether a connection should be recorded or monitored live if configured accordingly (usually via the genucenter Management Station). As long as rendezvous is configured to allow this, the operator can grant the maintainer control of the keyboard and mouse of the target system, and revoke that control.

The configuration data is imported via the configuration file. It cannot be modified locally.

The operator GUI can be accessed directly via the genucenter or locally via the genubox using a special operator login. It can also be accessed using genuReSI. The operator GUI is described in the manuals for genucenter/genubox. Installation and configuration are described in chapter 2.

4.2 Establishing/Terminating the Maintenance Connection

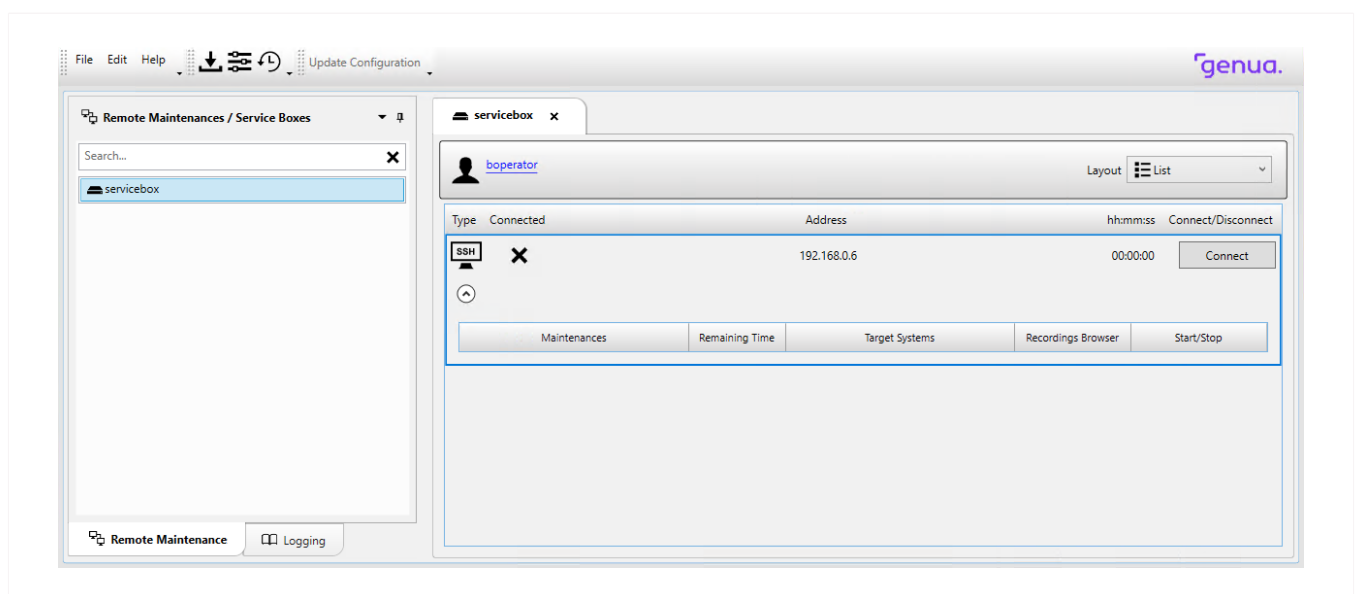

Figure 4.1: Establishing the Connection – Operator

The imported operator connections are listed on the left side of the screen. More details about each connection are listed on the right. After selecting the operator connection, click on the **Connect** button. This only establishes the SSH connection to the genubox. It does not start a maintenance connection.

Note: If an authorization via LDAP/Active Directory is configured for the connection, you may have to use a custom LDAP login name to access the Service Box. In this case, enter the LDAP login name at **Settings** → **SSH** in the **LDAP Loginname** field.

The available connections are displayed in the lower section of the main window. These can also be started with the **Start** button.

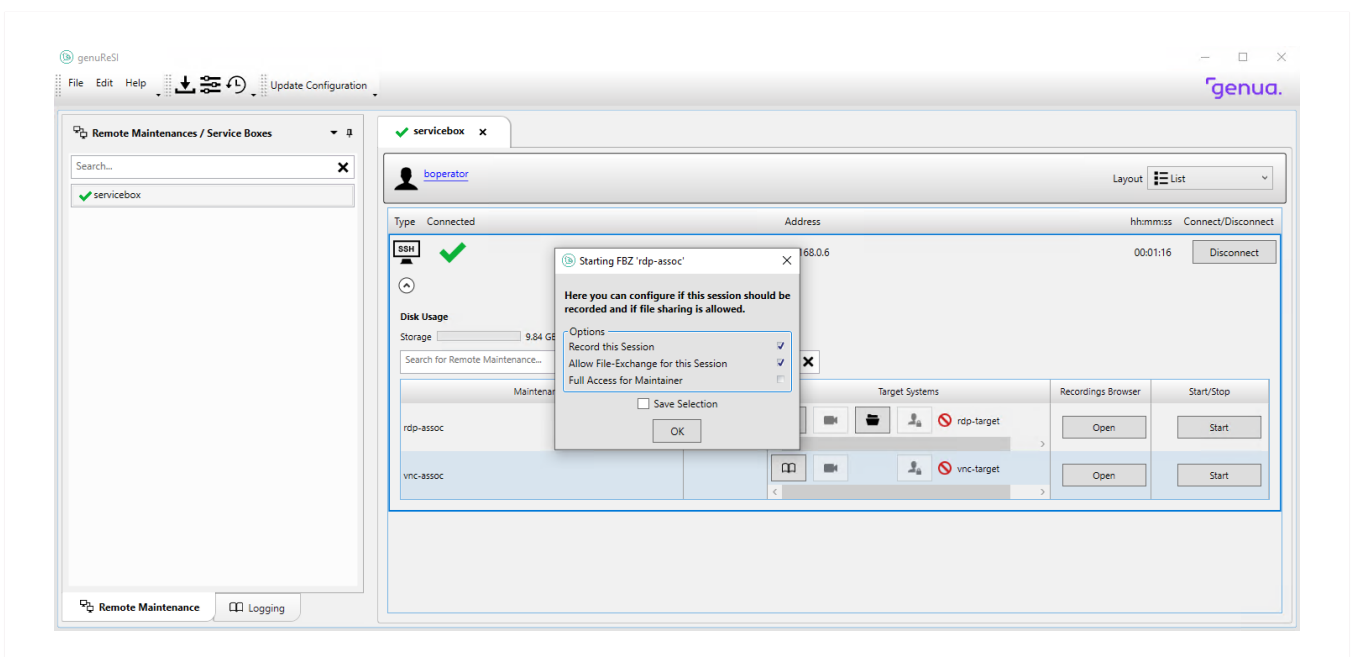

Figure 4.2: Establishing the Connection

A camera icon next to the connection (under Forwardings) signals that recording has been configured. The explorer icon signals that the data exchange option is configured, and the access control icon that access control at runtime is enabled.

If the history is enabled (see chapter Settings), a reason for establishing the connection can be specified. The recording and share options can also be enabled in this window. The privileges to allow the maintainer to start the maintenance can be defined by activating the respective check boxes.

Once connections have been established, this will be visible in the upper section (1) under “Connected”, indicating that the SSH session to the genubox upstream of the target system being maintained has been established. The connection to the genubox can be terminated with the **Disconnect** button. This does not affect maintenance connections.

Figure 4.3: Connections Overview

The lower section under Forwardings (2) shows whether the operator has enabled connections from the genubox to the machine being maintained, and which connections the operator has enabled. The status of the maintainer's connection is shown under Maintainer (3). The time window of a maintenance connection can be edited with a click on Remaining Time (4). Clicking on **Stop** allows the operator to terminate the connection from the genubox to the machine being maintained.

4.3 Access Control at Runtime

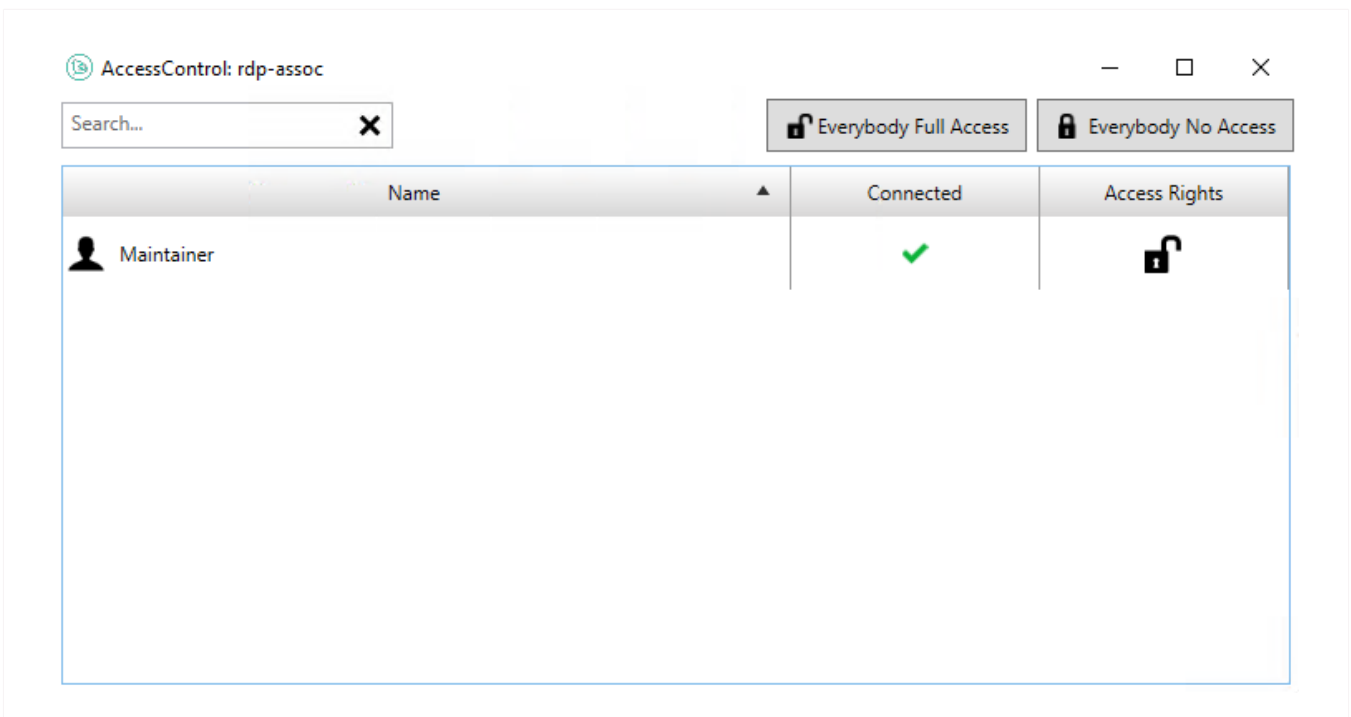

Figure 4.4: Connections Overview

The operator can grant or revoke access to the target system keyboard and mouse at runtime as long as this option is enabled in the configuration. To modify these privileges, the operator must click on the access control icon in the **Forwardings** section. The window shown in figure 4.4 appears. Clicking on the open padlock (in this case) allows the operator to revoke the maintainer's access to the mouse and keyboard. The padlock is closed when access is revoked. Clicking on the closed padlock opens it again and grants the maintainer access to the target system keyboard and mouse again.

4.4 Recording the Connection with RDP and SSH

It is possible to record RDP and SSH sessions and monitor active sessions (recording function). This must be started by the operator. The maintainer cannot control this. The camera icon for the connection indicates whether recording is configured (see figure 4.3).

If a connection with recording has been started, the operator can monitor the active session live by clicking on the camera icon. The blinking camera icon in the newly opened session window means that the session is currently being recorded. You can also see whether the maintainer is currently connected.

Figure 4.5: Recording in Active Session

Clicking on the **Open** button under Recordings Browser opens the window with the previously recorded sessions. These can be downloaded in raw format, converted to VP8 format, or deleted. Converted recordings can also be downloaded to the local workstation and viewed there.

Make sure to delete recordings that are no longer required in a timely manner to prevent using up available storage space.

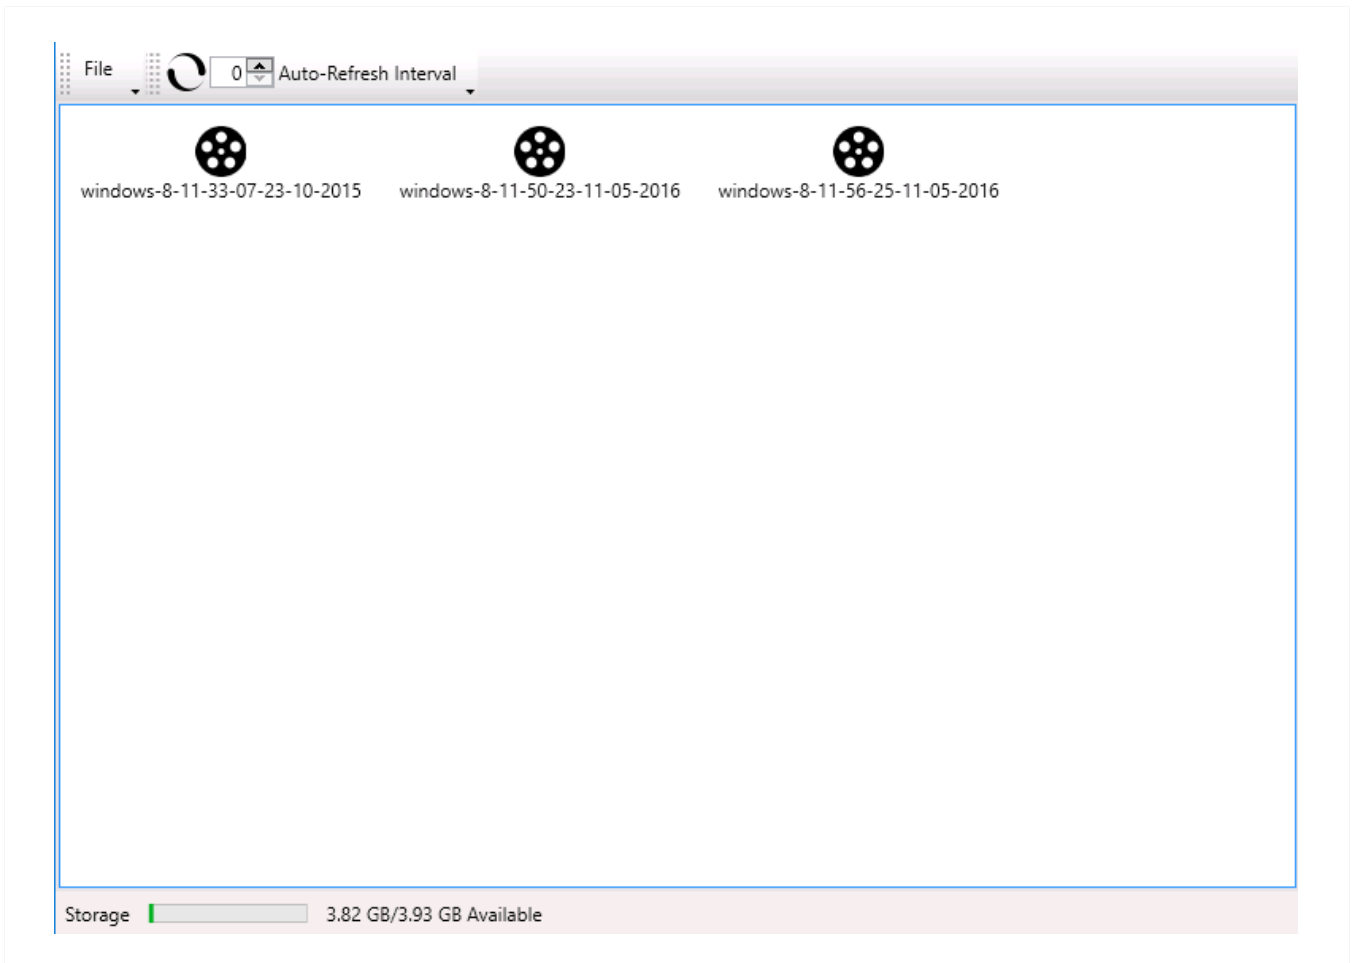

Figure 4.6: Downloading/Converting Recordings

4.5 Share Option

If the share option (data exchange) is enabled, the operator can click on the explorer icon to open the explorer for the operator. All files copied (upload and download) are displayed here. The operator can also download the files using the download icon in the toolbar.

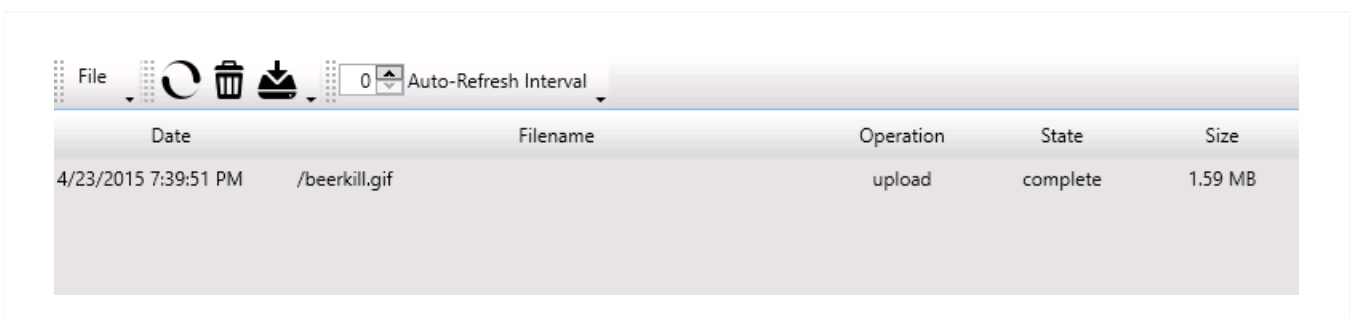

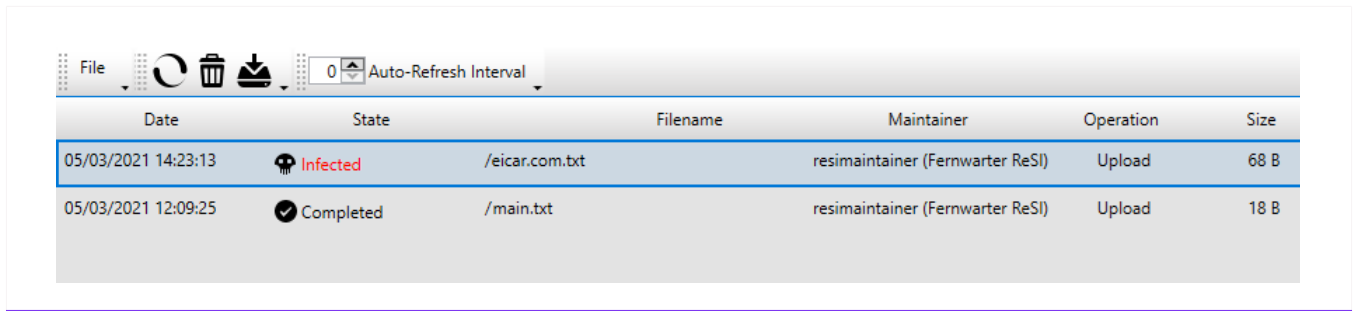

Figure 4.7: File Exchange

If a virus scanner connected via ICAP has been configured for the Rendezvous Box, transferred files will be checked for malware automatically. The files will only be available after the virus

scanner has approved them. The file transfer status displays more information about this process when necessary.

Date	State	Filename	Maintainer	Operation	Size
05/03/2021 14:23:13	 Infected	/eicar.com.txt	resimaintainer (Fernwarter ReSI)	Upload	68 B
05/03/2021 12:09:25	 Completed	/main.txt	resimaintainer (Fernwarter ReSI)	Upload	18 B

Figure 4.8: Malware detected (“Infected”)

4.6 Configuration Updates

The operator needs a valid configuration file for the initial connection between genuReSI App and Service Box. Usually, this file is created by the administrator in the Central Management Station genucenter.

Once an active SSH connection to the Service Box is established, configuration changes are automatically transmitted and displayed with every genuReSI status check. These configuration changes, e.g., additional connections, are usually also done via the genucenter. Therefore, there is no need to manually update configuration files, as long as the operator is able to connect to the Service Box with the latest configuration.

Note: Unlike the maintainer, the operator is not required to confirm changed configurations. The new configuration is immediately displayed in the operator view.

Alternatively, click [Update Configuration](#) in the title bar. genuReSI App checks for updates on every Rendezvous Box configured for SSH and updates the local configuration as required.

4.7 Logging/History

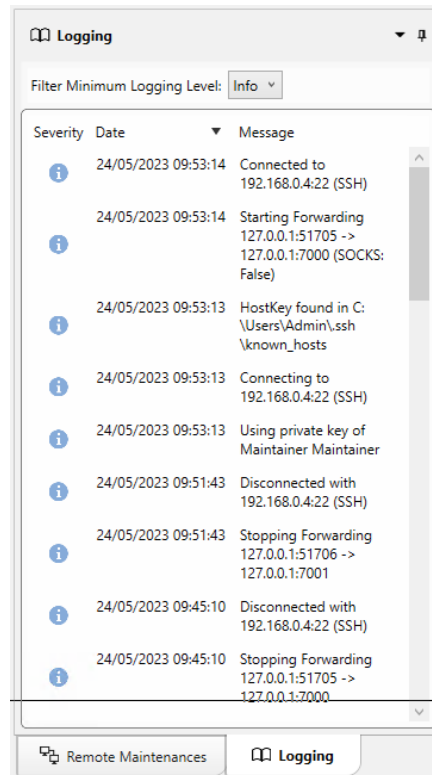

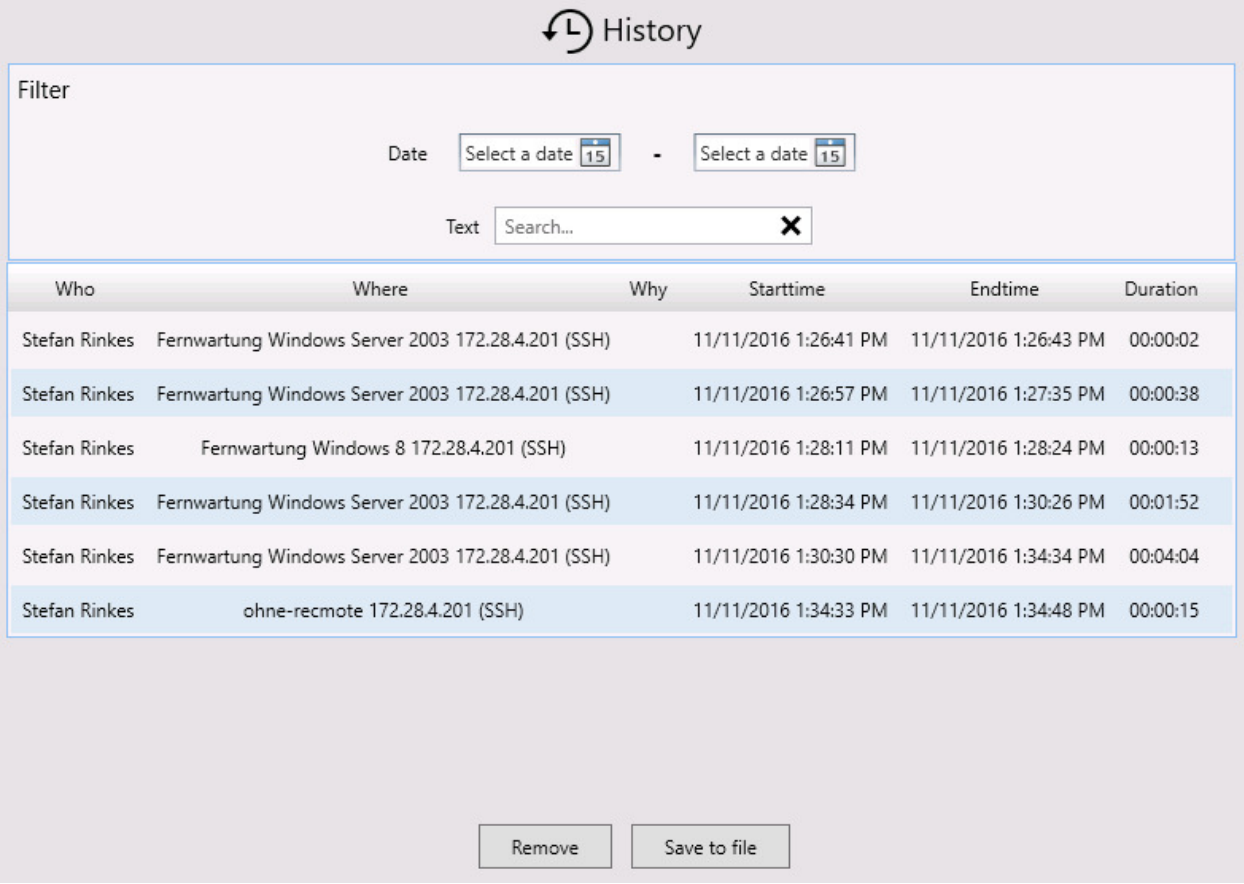

Figure 4.9: Logging

Clicking on the **Logging** tab in the main window displays the genuReSI log data and the connections. The logging levels **Info**, **Debug**, and **Error** are available.

To show the connection data for the recent connections (History), select the last icon in the toolbar: **History**. In the history window, the time frame for the connections can be defined and search text can be entered. The data can be saved to a local file so it can be included with a support request, for example, to assist with troubleshooting.

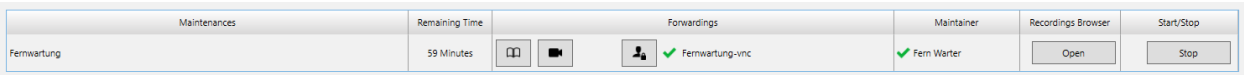

The History interface features a filter section at the top with a date range selector (from 15 to 15) and a search text field. Below this is a table with the following data:

Who	Where	Why	Starttime	Endtime	Duration
Stefan Rinkes	Fernwartung Windows Server 2003	172.28.4.201 (SSH)	11/11/2016 1:26:41 PM	11/11/2016 1:26:43 PM	00:00:02
Stefan Rinkes	Fernwartung Windows Server 2003	172.28.4.201 (SSH)	11/11/2016 1:26:57 PM	11/11/2016 1:27:35 PM	00:00:38
Stefan Rinkes	Fernwartung Windows 8	172.28.4.201 (SSH)	11/11/2016 1:28:11 PM	11/11/2016 1:28:24 PM	00:00:13
Stefan Rinkes	Fernwartung Windows Server 2003	172.28.4.201 (SSH)	11/11/2016 1:28:34 PM	11/11/2016 1:30:26 PM	00:01:52
Stefan Rinkes	Fernwartung Windows Server 2003	172.28.4.201 (SSH)	11/11/2016 1:30:30 PM	11/11/2016 1:34:34 PM	00:04:04
Stefan Rinkes	ohne-recmote	172.28.4.201 (SSH)	11/11/2016 1:34:33 PM	11/11/2016 1:34:48 PM	00:00:15

At the bottom of the interface are two buttons: "Remove" and "Save to file".

Figure 4.10: History

The operator can open the current log file for an active connection using the **Logging** (book icon) button:

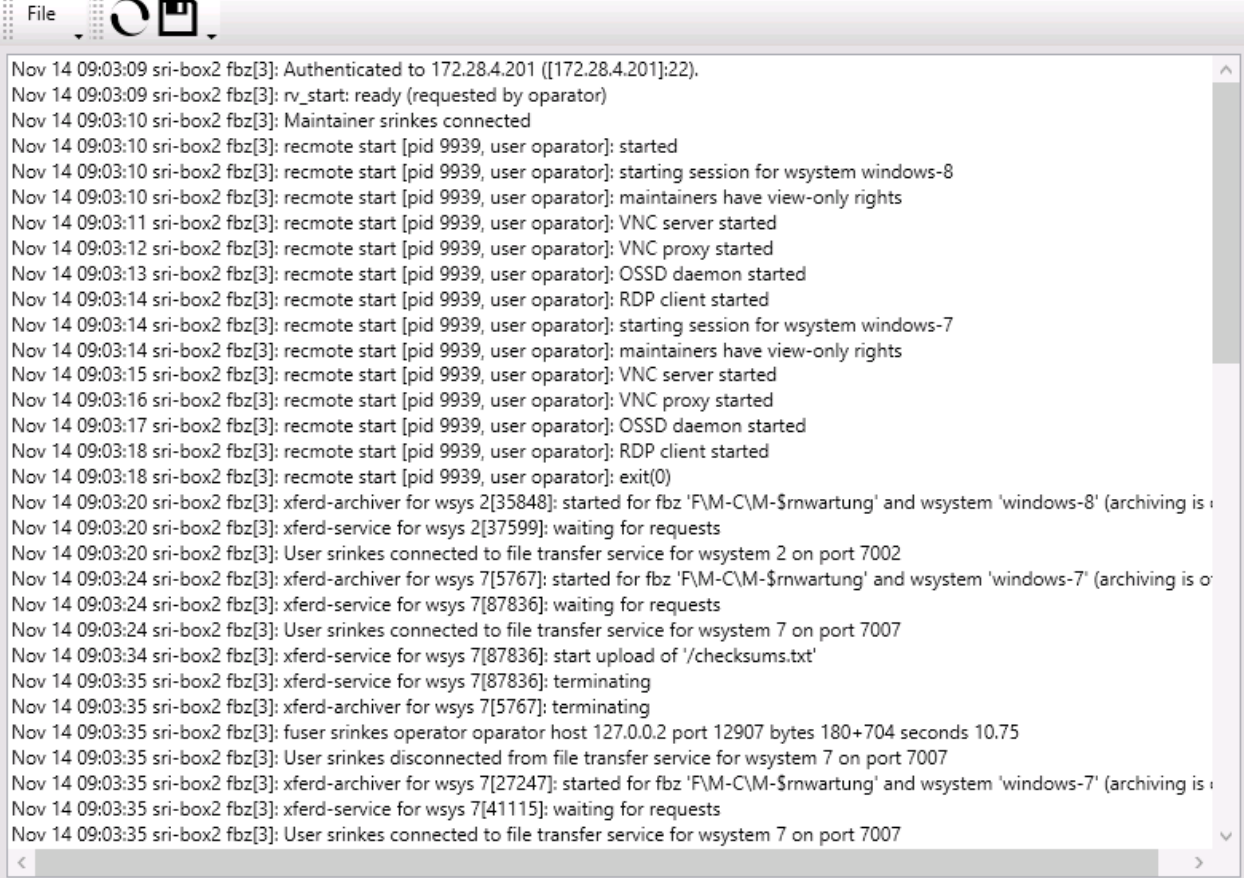

The Logging Active Session interface displays the following information for an active session:

Maintenances	Remaining Time	Forwardings	Maintainer	Recordings Browser	Start/Stop
Fernwartung	59 Minutes	Fernwartung-vc	Fern Wärter	Open	Stop

Figure 4.11: Logging Active Session

This is displayed in a separate window:

```

Figure 4.12: Log Data Output

4.8 Local Settings

A number of settings can be configured using the **Settings** icon in the toolbar:

- **Application Settings:**
General settings can be configured here, such as theme, activation of history and logging level.
- **SSH:**
SSH settings can be configured here, such as SSH forwarding and LDAP username, but also the network adapter for mapping addresses.
- **Plugins:**
Installing/uninstalling plugins, see chapter 3.9.
- **Smartcard:**
File path to the smart card middleware.
- **Commands:**
Definition of commands, see chapter 3.8.

- **Roles:**
Overview of available roles and settings.

Figure 4.13: Settings

4.9 genuReSI Update

genuReSI has an autoupdate feature: When the app is started, it automatically checks for updates of the [ReSI.exe](#) file. If a new version is available, the dialog box **Update Available** is displayed. Click [Yes](#) to install the update. After that, you have to restart the ReSI application.

The update installs the latest version of the [ReSI.exe](#) file. The previous version is stored as [ReSI_old.exe](#) in the TEMP directory.

The autoupdate feature is enabled by default. To disable the feature, navigate to [Settings](#) → [Application Settings](#) and deactivate the checkbox **Check for Updates on Start**. All updates have to be triggered manually now.

Chapter 5

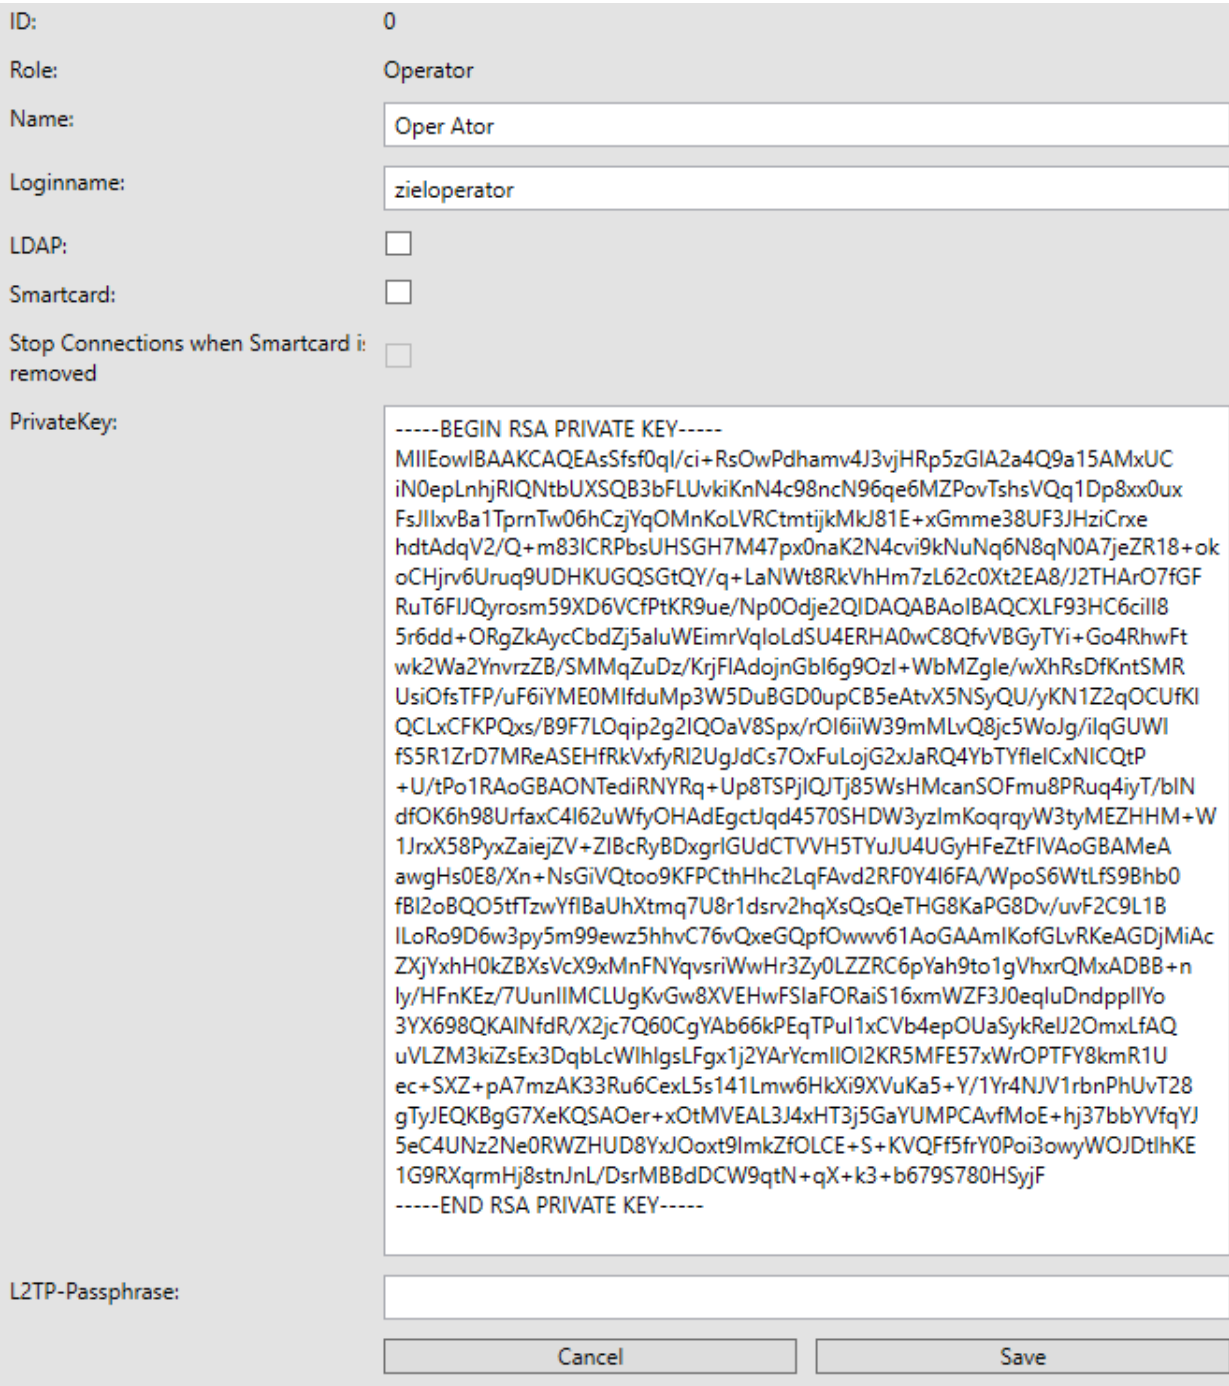

Advanced Configuration

5.1	Configuration Files	36
5.2	Role Management	37
5.3	Using a Smart card	38
5.4	Use with Firewall/NAT Gateway	41
5.5	HTTP Proxy for SSH	42
5.6	Administrative Port Forwarding Access	42
5.7	Administrative Dynamic Port Assignment for Forwardings	42
5.8	GUI Layout	44
5.9	New Commands	45
5.10	Changing the Plugin Directory	45

5.1 Configuration Files

genuReSI configuration and log files are located in the respective user directories at [AppData\Local\genua_GmbH](#) and [AppData\Roaming\ReSI](#). These directories should be included in any backups.

5.2 Role Management

Figure 5.1: Role Management

The configuration files, including the roles (login name and private key), are usually created on the management system and do not have to be edited locally. If values such as the private key have to be changed, this can be done in the **Roles** menu in the toolbar. To do so, click on the role. This opens an edit window. Save the changes with the [Save](#) button.

5.3 Using a Smart card

A smart card can be used to authenticate the operator and the maintainer.

5.3.1 PKCS#11 Module

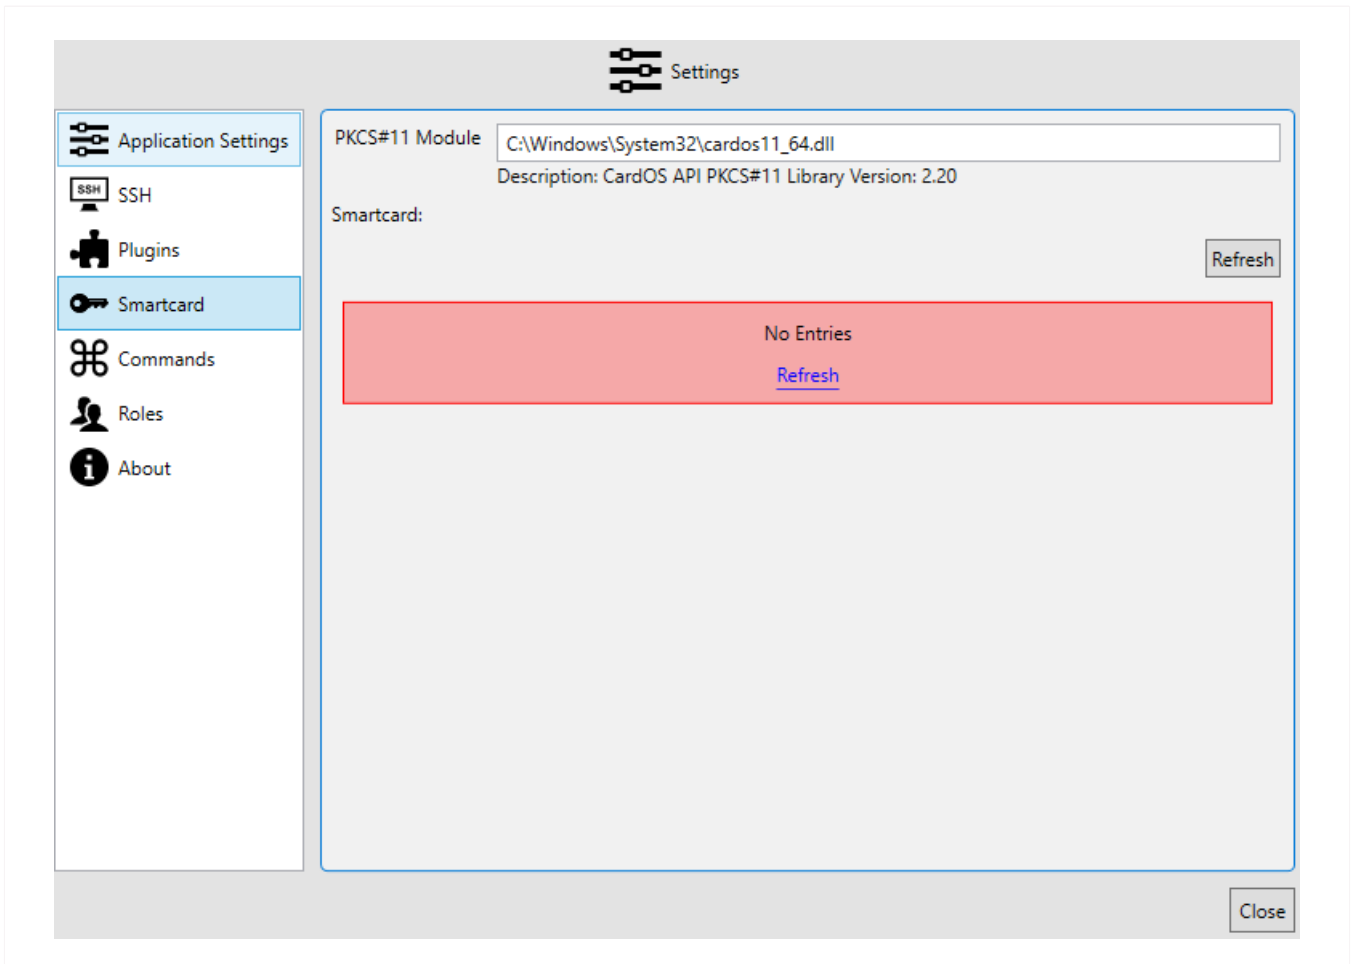

Figure 5.2: Selecting the PKCS Module

Enter the file path to your PKCS#11 middleware under [Settings](#) → [Smartcard](#) in genuReSI. The file path can be found in the manual for your smart card software.

5.3.2 Smart Card Assignment

To support smart card authentication for a user, select the respective user under [Settings](#) → [Roles](#). Check the **Smartcard** box and then apply the changes by clicking on **Save**.

If existing connections should be stopped when the smart card is removed, check the **Stop Connections when Smartcard is removed** box as well.

Note:

This option can lead to problems with contact free smart cards, since these are only active during the first initialization and are then removed.

5.3.3 Assigning the Public Key in genucenter

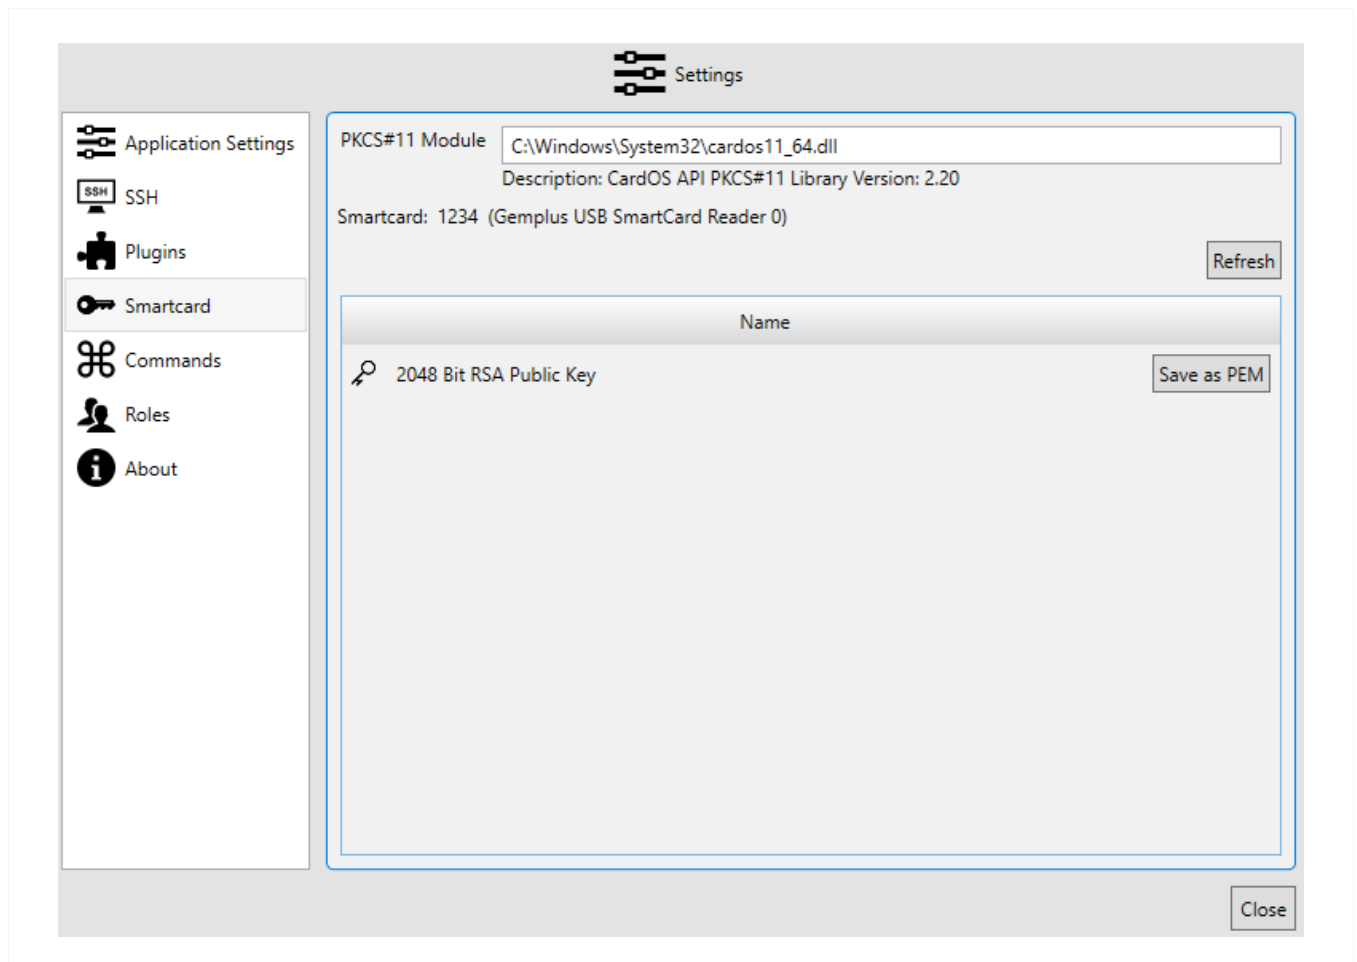

Figure 5.3: Smart Card Menu

The smart card public key must be known to the Rendezvous Box so you can authenticate using the smart card:

1. Export the public key of the user's smart card in the genuReSI App GUI at [Settings](#) → [Smartcard](#) by clicking on **Save as PEM**.
2. Upload the public key in the genucenter:
 - (a) In the genucenter, navigate to either [Rendezvous](#) → [Operators](#) → [<genuReSI user>](#) or [Rendezvous](#) → [Maintainers](#) → [<genuReSI user>](#) in accordance with the user's designated function.
 - (b) In the **Access via SSH** section, activate the checkbox **Enable SSH key login**.
 - (c) Also, use **Upload file with key** to upload the exported public key.
 - (d) Save your changes and update the configuration of all participating systems.

5.3.4 Establishing the Connection

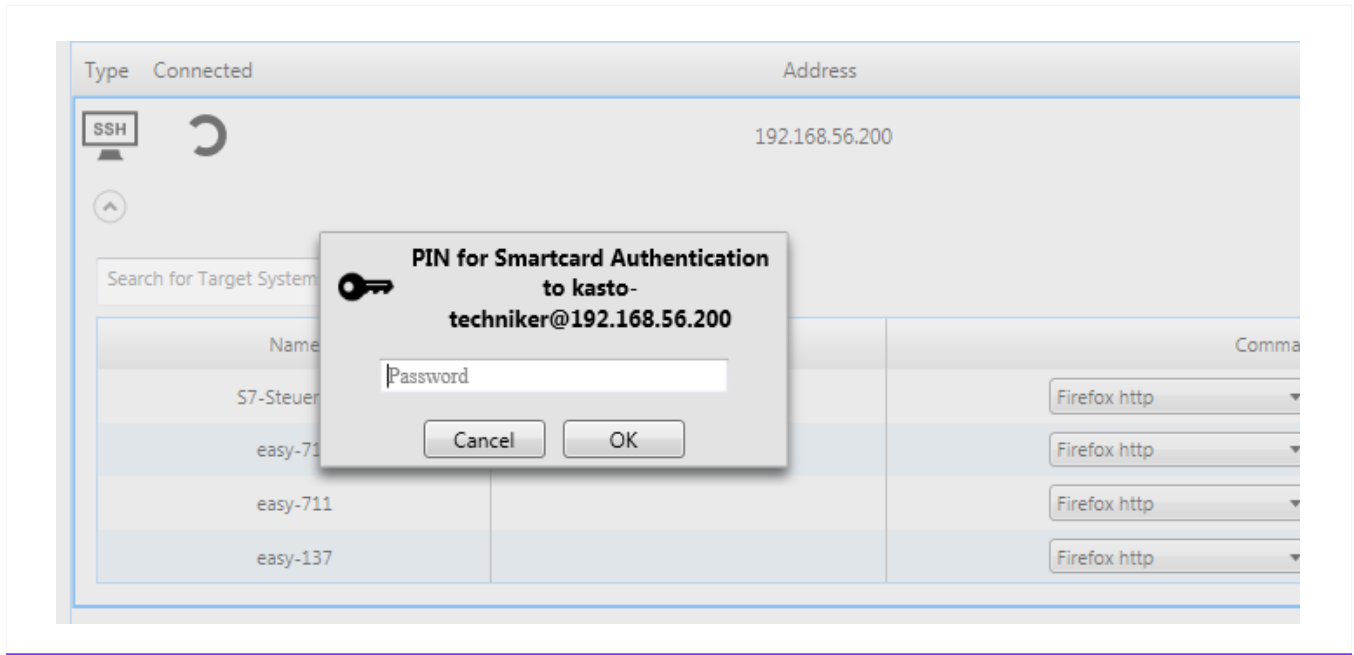

Figure 5.4: Smart Card PIN Entry

When establishing the connection, you will be asked for your smart card's PIN. After successfully entering it, you will have access to your connections.

5.4 Use with Firewall/NAT Gateway

5.4.1 SSH Forwarding

If your Rendezvous Box is located behind a firewall or a NAT gateway and is not directly reachable, you can set up SSH forwarding to enable the connection to the Rendezvous Box. On the firewall, a direct port forwarding rule that forwards SSH to the Rendezvous Box must be added.

Note: A maximum of 50 port forwardings is allowed per SSH connection.

Enter the IP address/hostname and/or the port for which forwarding is enabled in genuReSI under [Settings](#) → [SSH](#) → [SSH Redirection](#).

5.5 HTTP Proxy for SSH

If it is not possible to set up static port forwarding for SSH to the Rendezvous Box, SSH can also be forwarded via an HTTP proxy.

You can either use the HTTP proxy saved in your Windows system or enter a different proxy. If the proxy requires authentication, enter your access data in the HTTP Proxy for SSH field in the following format.

`Username:Password@IP address/Hostname:Port`

5.6 Administrate Port Forwarding Access

A genuReSI user can configure [Settings](#) → [SSH](#) → [Port Forwardings](#) to allow other system users to access existing port forwardings. On centrally administrated systems, e.g. jump hosts, the administrator can permanently enable or disable this functionality for all users as follows:

1. Open the Windows registry database.
2. Create the new key `HKEY_LOCAL_MACHINE\SOFTWARE\genua \ReSI` and navigate to it.
3. Add this entry to the newly created key.

Name	<code>MultiuserPortSeparation</code>
Type	<code>REG_DWORD</code>
Data	1 (to permanently disable access) or 0 (to permanently enable access)

4. The check box at [Settings](#) → [SSH](#) → [Port Forwardings](#) is grayed out now and cannot be changed anymore.

The check box is available again when the key is deleted.

5.7 Administrate Dynamic Port Assignment for Forwardings

On centrally managed systems such as a jump host the administrator can permanently enable dynamic port assignment for all users and forwardings in order to avoid port conflicts caused by static assignments. Proceed as follows:

1. Open the Windows registry database.
2. Create the new key `HKEY_LOCAL_MACHINE\SOFTWARE\genua \ReSI` and navigate to it.

3. Add this entry to the newly created key.

Name	<code>DynamicPortAssignment</code>
Type	<code>REG_DWORD</code>
Data	<code>1</code> (to permanently enable dynamic port assignment) or <code>0</code> (to permanently disable dynamic port assignment)

5.8 GUI Layout

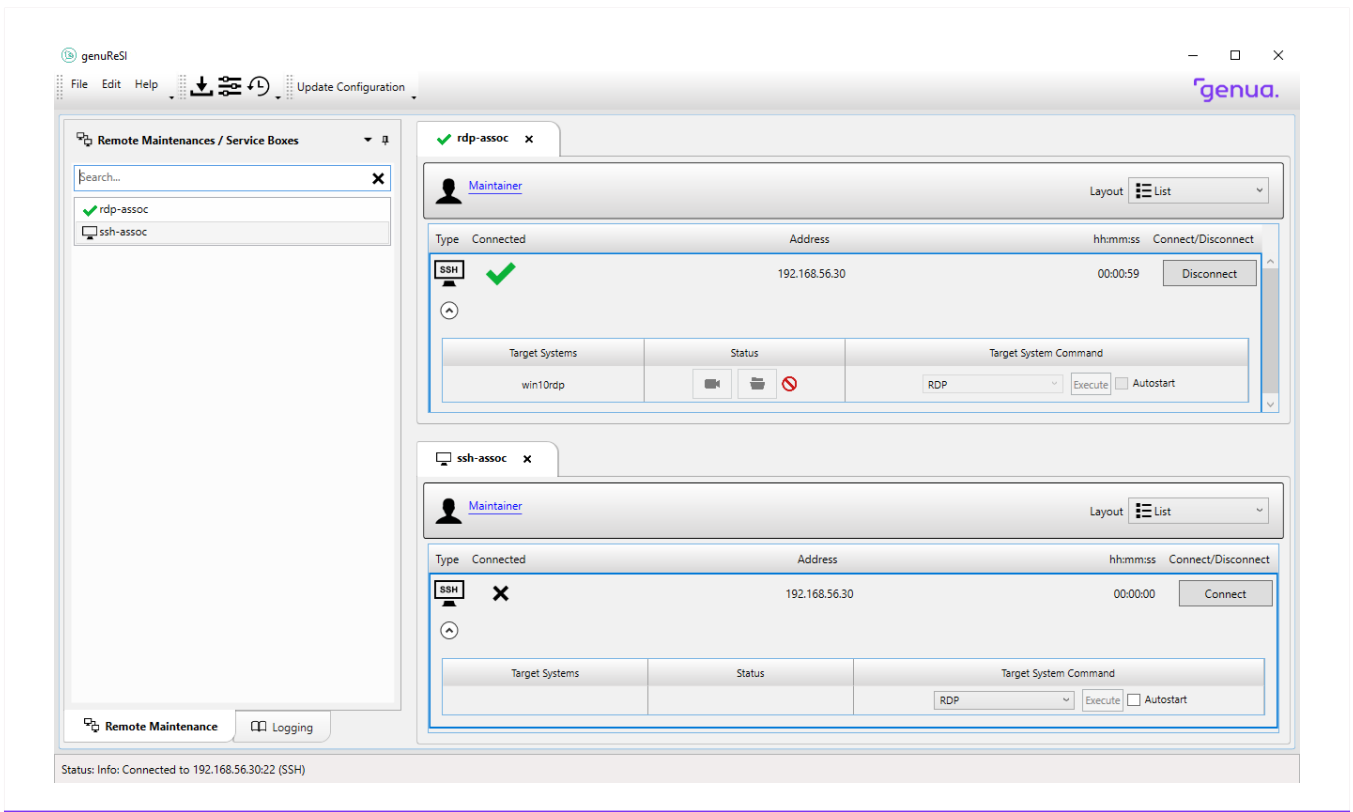

Figure 5.5: GUI Layout

The genureSI application uses what is known as a docking mechanism. This allows windows to be moved, docked to the editor frame, or even arranged across multiple screens (see <https://docs.microsoft.com/en-us/visualstudio/ide/customizing-window-layouts-in-visual-studio>, "Arrange and dock windows"). Thus, you can adjust and arrange the screen at your discretion.

5.9 New Commands

Internally, the rendezvous concept uses port forwardings to direct connections to the target system via the rendezvous server. In the **Commands** menu in the toolbar, commands can be defined to be executed on the target system. To do so, the syntax of the command must be known. The variables `%HOST%` and `%PORT%` designate the hostname and the port used. Windows environment variables are supported.

Example: PuTTY should be used to open an SSH connection on the target system.

Filename defines where the `putty.exe` application is located on the local file system. Under **Arguments**, define the command `-P %PORT% %HOST%`, as PuTTY specifies the port with `-P` argument on the command line.

5.10 Changing the Plugin Directory

You can customize the default directory for genuReSI plugins/extensions via the Windows registry database. The administrator can use this feature to, e.g., create a common plugin directory for multiple maintainers on a jump host.

Note: To add or delete plugins, a maintainer needs writing permissions in the newly created directory.

Customize the plugin directory as follows:

1. Change to the maintainer system.
2. Create the new plugin folder if it does not exist yet.
3. Open the Windows registry database.
4. Create the new key `HKEY_LOCAL_MACHINE\SOFTWARE\genua \ReSI` and navigate to it.
5. Add this entry to the newly created key.

Name	<code>PluginPath</code>
Type	<code>REG_SZ</code> (for a regular directory path) or <code>REG_EXPAND_SZ</code> (for a directory path containing expanding variables, e.g., <code>%UserProfile%</code>)
Data	the absolute path to new plugin directory (e.g., <code>C:\Common\Plugins\</code>)

6. Optional: Copy your preferred plugins to the plugin directory.

genuReSI App uses the new plugin directory after the next start.

Chapter 6

STEP7 via Rendezvous

6.1	GUI Installation of the Loopback Adapter	48
6.2	Command Line Installation of the Loopback Adapter	49
6.3	IP Configuration	49

To use the Siemens STEP7 protocol with rendezvous, we recommend adding a loopback adapter in Windows. The maintainer can do this directly via the genuReSI App GUI. Additionally, the installation can be performed via the command line, e.g., for an automatic installation with a centralized management tool.

6.1 GUI Installation of the Loopback Adapter

Note: Administrator privileges are required to install the Microsoft loopback adapter.

1. Start genuReSI App.
2. Navigate to [Settings](#) → [SSH](#).
3. In the section **Network Adapter for Mapping Addresses**, click on [Install Loopback Driver](#). The loopback adapter will be installed.
4. In the drop-down menu, select the new loopback adapter as the **Network Adapter for Mapping Addresses**. The adapter will be used by genuReSI App now.
5. Click on [Close](#).
6. Continue with section 6.3

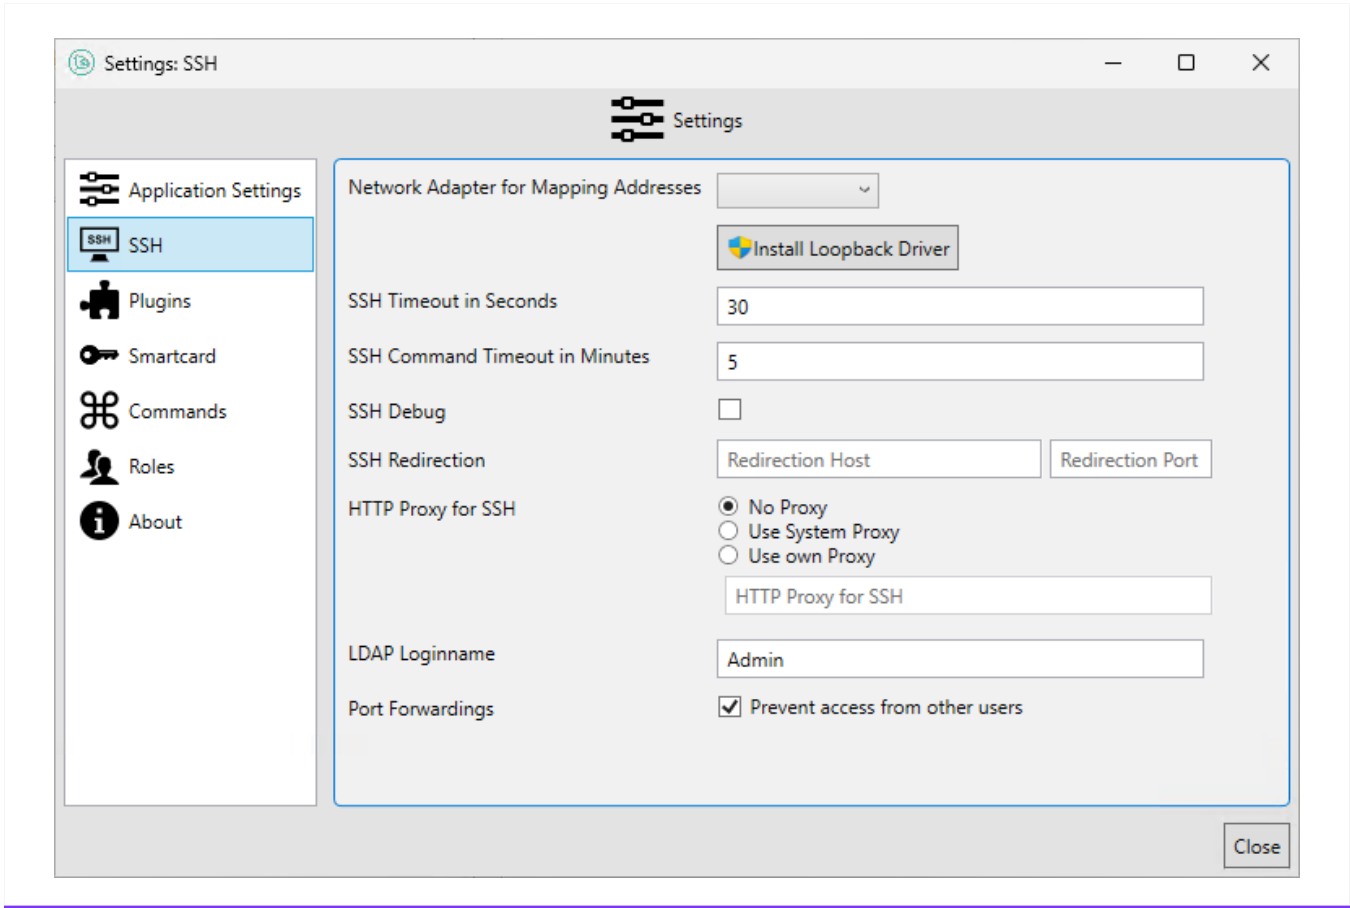

Figure 6.1: genuReSI Loopback Adapter

6.2 Command Line Installation of the Loopback Adapter

Note: Administrator privileges are required to install the Microsoft loopback adapter.

Execute the genuReSI application with the parameter `/install-loopback` for an automated installation of the loopback adapter.

```
ReSI.exe /install-loopback
```

Continue with section 6.3.

6.3 IP Configuration

Once the connection is established, Windows will ask whether genuReSI may assign an IP address to the loopback adapter. Confirm with `Yes`.

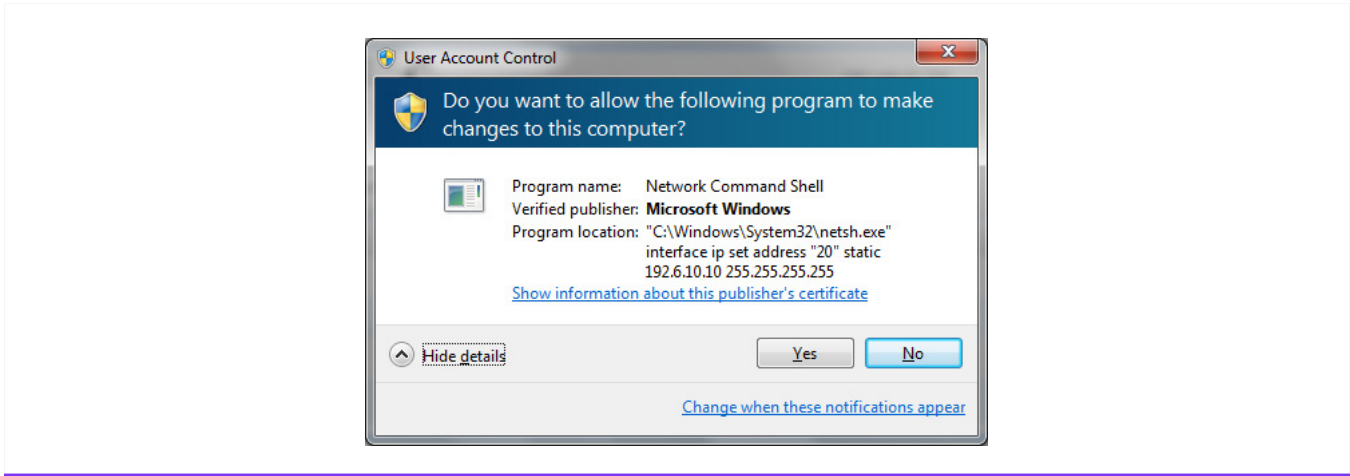

Figure 6.2: User Account Control

If the connection is established, the detailed view (switch to detailed view with **Ctrl**+**D**) will show the local IP address is set to **192.168.100.3**. This IP address is entered by the admin in advance as the S7 address in the genucenter.

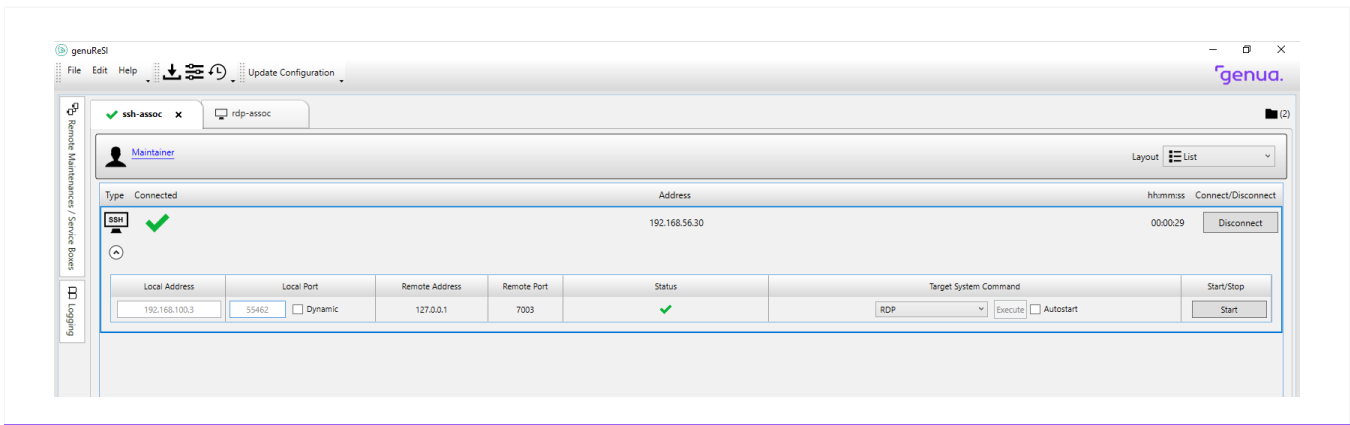

Figure 6.3: genuReSI with Active Connection

At this point, ipconfig also shows the IP address set by genuReSI:

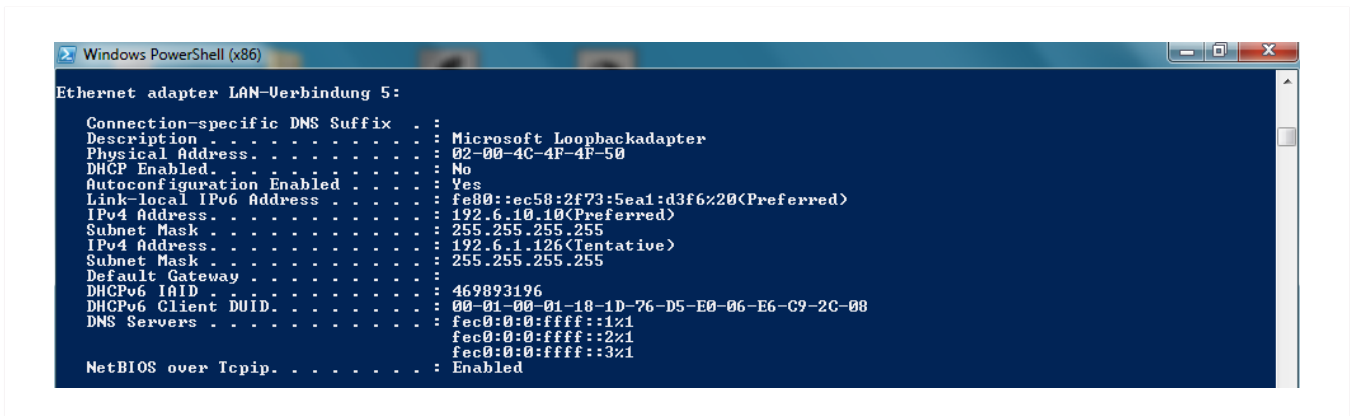

Figure 6.4: PowerShell with Mapping

Once genuReSI is closed, the IP addresses are cleared again.

| About genua

genua GmbH is a German IT security specialist and has been securing networks and providing top-quality security solutions since the company was founded in 1992. Our business activities cover securing sensitive interfaces in both public authorities and industry.

In addition, genua provides solutions to securely connect highly critical infrastructure, reliably encrypt data communication over the Internet, and supply remote maintenance and remote access for mobile employees and teleworkers.

Our solutions are developed and produced in Germany – many companies and security-conscious authorities rely on solutions from genua to protect their IT.

genua is a member of the Bundesdruckerei Group.

genua GmbH, Domagkstrasse 7, 85551 Kirchheim, Germany
